Azetidines and cyclobutanes as Histamine H3 receptor antagonists

The present invention relates to Histamine H3 receptor antagonists, pharmaceutical compositions thereof, the preparation of such compounds as well as the production and use as medicament.

The histamine H3 receptor is a G protein-coupled receptor (GPCR) and one out of four receptors of the histamine receptor family. Histamine receptors have long been attractive drug targets, mirrored in the development of antihistamines, which were directed at the histamine H1 receptor for the treatment of allergic reactions or at the histamine H2 receptor to ameliorate gastric ulcers by inhibiting gastric acid secretion. The H3 receptor has been identified as a presynaptic autoreceptor, regulating the release of histamine (Arrang et al. (1983) Nature: 302; 832 - 837), as well as a heteroreceptor that regulates the release of many other important neurotransmitters (acetylcholine, norepinephrine, dopamine, and serotonin).

Structurally divergent H3 receptor antagonists / inverse agonists have been developed and shown to comprise activity in a variety of cognition tests in mice and rat (e.g. Esbenshade et al. (2006) Mol Interventions: 6 (2); 77 - 88) as well as in models for sleeping disorders and energy balance. From these studies it is concluded that such antagonists comprise a potential treatment for a variety of disorders affecting cognition (e.g., Alzheimer's disease, Parkinson's disease, Attention Deficit and Hyperactivity Disorder, Schizophrenia, Foetal Alcohol Syndrome, Mild Cognitive Impairment, Age-related Memory Dysfunction, Down Syndrome and others), as well as sleep (e.g., hypersomnia and narcolepsy), and energy homeostasis (e.g. obesity) (Witkin & Nelson (2004) JPET: 103; 1 - 20; Hancock & Brune (2005) Exp Opin Inves Drugs: 14 (3), 223 - 241).

Accordingly, Histamine H3 receptor antagonists are described in the art for the treatment of the above mentioned diseases and disorders.

In WO-A 2007/080140 cyclylhexyl piperazinyl methanone derivatives are disclosed, which are useful as H3 receptor modulators.
In WO-A 2006/136924 cyclo butyl derivatives are disclosed as Histamine-3 receptor antagonists.

US-A 4956359 describes anticonvulsants and antiepileptics having similar chemical structures without referring to H3 receptor antagonism.

However there is a continuing need for new compounds useful as Histamine H3 receptor antagonists.

Thus, an object of the present invention is to provide a new class of compounds as Histamine H3 receptor antagonists which may be effective in the treatment of H3 receptor related diseases and may show improved pharmaceutically relevant properties including activity, ADMET properties and/or reduced side effects.

Accordingly, the present invention provides compounds of formula (I)

Prodrugs of the compounds of the invention are also within the scope of the present invention. "Prodrug" means a derivative that is converted into a compound according to the present invention by a reaction with an enzyme, gastric acid or the like under a physiological condition in the living body, e.g. by oxidation, reduction, hydrolysis or the like, each of which is carried out enzymatically. Examples of a prodrug are compounds, wherein the amino group in a compound of the present invention is acylated, alkylated or phosphorylated to form, e.g., eicosanoyl amino, alanylamino, pivaloyloxymethylamino or wherein the hydroxyl group is acylated, alkylated, phosphorylated or converted into the borate, e.g. acetyloxy, palmitoylexy, pivaloylexy, succinylxy, fumaryloxy, alanylxy or wherein the carboxyl group is esterified or amidated. These compounds can be produced from compounds of the present invention according to well-known methods.

Metabolites of compounds of formula (I) are also within the scope of the present invention.

Where tautomerism, like e.g. keto-enol tautomerism, of compounds of formula (I) may occur, the individual forms, like e.g. the keto and enol form, are comprised separately and together as mixtures in any ratio. Same applies for stereoisomers, like e.g. enantiomers, cis/trans isomers, conformers and the like.

Especially, when enantiomeric or diastereomeric forms are given in a compound according to formula (I) each pure form separately and any mixture of at least two of the pure forms in any ratio is comprised by formula (I) and is a subject of the present invention.

Isotopic labeled compounds of formula (I) are also within the scope of the present invention. Methods for isotope labeling are known in the art. Preferred isotopes are those of the elements H, C, N, O and S.

If desired, isomers can be separated by methods well known in the art, e.g. by liquid chromatography. Same applies for enantiomers by using e.g. chiral stationary phases. Additionally, enantiomers may be isolated by converting them into diastereomers, i.e.
coupling with an enantiomerically pure auxiliary compound, subsequent separation of the resulting diastereomers and cleavage of the auxiliary residue. Alternatively, any enantiomer of a compound of formula (I) may be obtained from stereoselective synthesis using optically pure starting materials, reagents and/or catalysts.

In case the compounds according to formula (I) contain one or more acidic or basic groups, the invention also comprises their corresponding pharmaceutically or toxicologically acceptable salts, in particular their pharmaceutically utilizable salts. Thus, the compounds of the formula (I) which contain acidic groups can be used according to the invention, for example, as alkali metal salts, alkaline earth metal salts or as ammonium salts. More precise examples of such salts include sodium salts, potassium salts, calcium salts, magnesium salts or salts with ammonia or organic amines such as, for example, ethylamine, ethanolamine, triethanolamine or amino acids. Compounds of the formula (I) which contain one or more basic groups, i.e. groups which can be protonated, can be present and can be used according to the invention in the form of their addition salts with inorganic or organic acids. Examples for suitable acids include hydrogen chloride, hydrogen bromide, phosphoric acid, sulfuric acid, nitric acid, methanesulphonic acid, p-toluenesulphonic acid, naphthalenedisulphonic acids, oxalic acid, acetic acid, tartaric acid, lactic acid, salicylic acid, benzoic acid, formic acid, propionic acid, pivalic acid, diethylacetic acid, malonic acid, succinic acid, pimelic acid, fumaric acid, maleic acid, malic acid, sulfaminic acid, phenylpropionic acid, gluconic acid, ascorbic acid, isonicotinic acid, citric acid, adipic acid, and other acids known to the person skilled in the art. If the compounds of the formula (I) simultaneously contain acidic and basic groups in the molecule, the invention also includes, in addition to the salt forms mentioned, inner salts or betaines (zwitterions). The respective salts according to the formula (I) can be obtained by customary methods which are known to the person skilled in the art like, for example by contacting these with an organic or inorganic acid or base in a solvent or dispersant, or by anion exchange or cation exchange with other salts. The present invention also includes all salts of the compounds of the formula (I) which, owing to low physiological compatibility, are not directly suitable for use in pharmaceuticals but which can be used, for example, as intermediates for chemical reactions or for the preparation of pharmaceutically acceptable salts.

The present invention provides compounds of general formula (I) as Histamine H3 receptor antagonists.

As described before, the histamine H3 receptor is a G protein-coupled receptor (GPCR) and one out of four receptors of the histamine receptor family. Histamine receptors have long been attractive drug targets, mirrored in the development of antihistamines, which were directed at the histamine H1 receptor for the treatment of allergic reactions or at the histamine
H2 receptor to ameliorate gastric ulcers by inhibiting gastric acid secretion. The H3 receptor has been identified as a presynaptic autoreceptor, regulating the release of histamine (Arrang et al. (1983) Nature: 302; 832 - 837), as well as a heteroreceptor that regulates the release of many other important neurotransmitters (acetylcholine, norepinephrine, dopamine, and serotonin). Structurally divergent H3 receptor antagonists / inverse agonists have been developed and shown to comprise activity in a variety of cognition tests in mice and rat (e.g. Esbenshade et al. (2006) Mol Interventions: 6 (2); 77 - 88) as well as in models for sleeping disorders and energy balance. From these studies it is concluded that such antagonists comprise a potential treatment for a variety of disorders affecting cognition (e.g., Alzheimer's disease, Parkinson's disease, Attention Deficit and Hyperactivity Disorder, Schizophrenia, Foetal Alcohol Syndrome, Mild Cognitive Impairment, Age-related Memory Dysfunction, Down Syndrome and others), as well as sleep (e.g., hypersomnia and narcolepsy), and energy homeostasis (e.g. obesity) (Witkin & Nelson (2004) JPET: 103; 1 - 20; Hancock & Brune (2005) Exp Opin Inves Drugs: 14 (3), 223 - 241).

The pharmacology of the H3 receptor seems not only to be determined by its localization but appears also to be regulated by differential splicing. Today more than 20 splice variants (isoforms) have been described but their functions have yet to be elucidated completely (Bongers et al. (2007) Biochem Pharm: 73; 1195 - 1204). The H3 receptor is localized primarily to the central nervous system (CNS), with highest expression, in rodents, in the cerebral cortex, hippocampal formations, striatum, and hypothalamus (Drutel et al. (2001) Mol Pharmacol: 59; 1 - 8). Similarly in human, H3 receptor expression is prominent in the basal ganglia, globus pallidus, hippocampus, and cortex (Martinez-Mir et al. (1990) Brain Res: 526; 322 327). Notably, many of these brain regions are critical for cognition (cortex and hippocampus) and sleep and homeostatic regulation (hypothalamus). The H3 receptor has been shown also to localize to regions which might be involved in pain sensation or transmission and therefore might offer treatment opportunities for different pain states (Cannon et al. (2007) Pain: 129; 76 - 92).

In addition to agonist-induced signaling, the H3 receptor is constitutively active and capable of signaling independently of agonist both in vitro and in vivo (Morisset et al. (2000) Nature: 408, 860 - 864).
All these considerations suggest that novel H3 receptor antagonists like the series in this application could be useful in the treatment of cognitive dysfunctions as well as sleeping and energy homeostasis disorders. The term "antagonist" also includes inverse agonists.

Preferably, the mammalian patient is a human patient.

Yet another aspect of the present invention is a pharmaceutical composition comprising at least one compound or a pharmaceutically acceptable salt thereof of the present invention together with a pharmaceutically acceptable carrier, optionally in combination with one or more other bioactive compounds or pharmaceutical compositions.

Preferably, the one or more bioactive compounds are lipase inhibitors, anorectic agents, selective serotonin uptake inhibitors, neurotransmitter reuptake blocker, agents that stimulate metabolism of body fat, anti-diabetic agents, lipid lowering agents, or histamine H1 receptor antagonists. A combination of one or more histamine H3 receptor antagonists of the present invention and histamine H1 receptor antagonists is preferred, especially for the treatment of allergic rhinitis, allergic congestion or nasal congestion.

"Pharmaceutical composition" means one or more active ingredients, and one or more inert ingredients that make up the carrier, as well as any product which results, directly or indirectly, from combination, complexation or aggregation of any two or more of the ingredients, or from dissociation of one or more of the ingredients, or from other types of reactions or interactions of one or more of the ingredients. Accordingly, the pharmaceutical compositions of the present invention encompass any composition made by admixing a compound of the present invention and a pharmaceutically acceptable carrier.

A pharmaceutical composition of the present invention may comprise one or more additional compounds as active ingredients like one or more compounds of formula (I) not being the first compound in the composition or other Histamine H3 receptor antagonists.

The active ingredients may be comprised in one or more different pharmaceutical compositions (combination of pharmaceutical compositions).

The term "pharmaceutically acceptable salts" refers to salts prepared from pharmaceutically acceptable non-toxic bases or acids, including inorganic bases or acids and organic bases or acids.
The compositions include compositions suitable for oral, rectal, topical, parenteral (including subcutaneous, intramuscular, and intravenous), ocular (ophthalmic), pulmonary (nasal or buccal inhalation), or nasal administration, although the most suitable route in any given case will depend on the nature and severity of the conditions being treated and on the nature of the active ingredient. They may be conveniently presented in unit dosage form and prepared by any of the methods well-known in the art of pharmacy.

In practical use, the compounds of formula (I) can be combined as the active ingredient in intimate admixture with a pharmaceutical carrier according to conventional pharmaceutical compounding techniques. The carrier may take a wide variety of forms depending on the form of preparation desired for administration, e.g., oral or parenteral (including intravenous). In preparing the compositions for oral dosage form, any of the usual pharmaceutical media may be employed, such as water, glycols, oils, alcohols, flavoring agents, preservatives, coloring agents and the like in the case of oral liquid preparations, such as, for example, suspensions, elixirs and solutions; or carriers such as starches, sugars, microcrystalline cellulose, diluents, granulating agents, lubricants, binders, disintegrating agents and the like in the case of oral solid preparations such as powders, hard and soft capsules and tablets, with the solid oral preparations being preferred over the liquid preparations.

Because of their ease of administration, tablets and capsules represent the most advantageous oral dosage unit form in which case solid pharmaceutical carriers are obviously employed. If desired, tablets may be coated by standard aqueous or nonaqueous techniques. Such compositions and preparations should contain at least 0.1 percent of active compound. The percentage of active compound in these compositions may, of course, be varied and may conveniently be between about 2 percent to about 60 percent of the weight of the unit. The amount of active compound in such therapeutically useful compositions is such that an effective dosage will be obtained. The active compounds can also be administered intranasally, for example, as liquid drops or spray.

The tablets, pills, capsules, and the like may also contain a binder such as gum tragacanth, acacia, corn starch or gelatin; excipients such as dicalcium phosphate; a disintegrating agent such as corn starch, potato starch, alginic acid; a lubricant such as magnesium stearate; and a sweetening agent such as sucrose, lactose or saccharin. When a dosage unit form is a capsule, it may contain, in addition to materials of the above type, a liquid carrier such as a fatty oil.

Various other materials may be present as coatings or to modify the physical form of the dosage unit. For instance, tablets may be coated with shellac, sugar or both. A syrup or elixir may contain, in addition to the active ingredient, sucrose as a sweetening agent, methyl and propylparabens as preservatives, a dye and a flavoring such as cherry or orange flavor.
Compounds of formula (I) may also be administered parenterally. Solutions or suspensions of these active compounds can be prepared in water suitably mixed with a surfactant such as hydroxypropyl-cellulose. Dispersions can also be prepared in glycerol, liquid polyethylene glycols and mixtures thereof in oils. Under ordinary conditions of storage and use, these preparations contain a preservative to prevent the growth of microorganisms.

The pharmaceutical forms suitable for injectable use include sterile aqueous solutions or dispersions and sterile powders for the extemporaneous preparation of sterile injectable solutions or dispersions. In all cases, the form should be sterile and should be fluid to the extent that easy syringability exists. It should be stable under the conditions of manufacture and storage and should be preserved against the contaminating action of microorganisms such as bacteria and fungi. The carrier can be a solvent or dispersion medium containing, for example, water, ethanol, polyol (e.g., glycerol, propylene glycol and liquid polyethylene glycol), suitable mixtures thereof, and vegetable oils.

Any suitable route of administration may be employed for providing a mammal, especially a human, with an effective dose of a compound of the present invention. For example, oral, rectal, topical, parenteral, ocular, pulmonary, nasal, and the like may be employed. Dosage forms include tablets, troches, dispersions, suspensions, solutions, capsules, creams, ointments, aerosols, and the like. Preferably compounds of formula (I) are administered orally.

The effective dosage of active ingredient employed may vary depending on the particular compound employed, the mode of administration, the condition being treated and the severity of the condition being treated. Such dosage may be ascertained readily by a person skilled in the art.

Starting materials for the synthesis of preferred embodiments of the invention may be purchased from commercially available sources such as Array, Sigma Aldrich, Acros, Fisher, Fluka, ABCR or can be synthesized using known methods by one skilled in the art.

In general, several methods are applicable to prepare compounds of the present invention. In some cases various strategies can be combined. Sequential or convergent routes may be used.

Examples

**Biological evaluation:**

**Cell-lines used to characterize invented compounds in vitro**

CHO-K1 cell line expressing human H3 receptors were purchased from Euroscreen (Gosselies, Belgium, Cat. no.: ES-392-C)

Human H3 receptor-expressing cell-lines were grown in Ham's F12 [Sigma, Cat. no. N6658], supplemented with 10% FBS [Sigma, Cat. no. F9665], 400\( \mu \)g/ml G418 [Sigma, Cat. no. N1876] and 250\( \mu \)g/ml Zeocin [Invitrogen, Cat. no. 46-0509]) according to the protocol provided by Euroscreen.

**cAMP quantification protocol for human H3 receptor testing**

The assay measures the ability of test compounds to inhibit Histamine receptor agonist-induced decrease of intracellular free cAMP (receptor is \( G_1 \) coupled).

Specifically, a cAMP quantification assay system from DiscoveRx (cAMP XS+; Cat. no. 90-0075) was used.

For the cAMP assay, confluent cells were detached from the culture vessels with 1x trypsin-EDTA solution (Sigma), and seeded into 384-well Costar plates (white, clear bottom, Cat. no. 3707) at a density of 10,000 cells per well. Cells were seeded in a volume of 50\( \mu \)l in medium without antibiotics and incubated overnight in a humidified atmosphere with 5% CO\(_2\) at 37°C. The cAMP assay was performed according to the protocol provided by DiscoveRx.

The cell culture medium was removed and the cells washed once with PBS (50 \( \mu \)l per well). The plates were emptied by inversion and 7.5 \( \mu \)l/well of compound in PBS (containing ImM IBMX and 0.03% BSA) were added and incubated for 30min at 37°C.
Subsequent 7.5 µl/well specific agonist solution was added and the plates for another 30 min incubated at 37°C.

The following agonist solution is used for the individual cell-lines:

hH3: 100 nM histamine, 10 µM forskolin in PBS (containing 1 mM IBMX and 0.03% BSA)

After the incubation with the agonist, 5 µl/well cAMP XS antibody solution was added followed by 20 µl/well Gal/EII/Lysis(1:5:19) + ED (1:1). The plates were incubated for one hour at room temperature and afterwards 20 µl/well EA reagent was added. The luminescence was developed for approximately three hours at room temperature and the plates were read out using a ‘BMG Novostar’ plate reader.

**Assaying of compounds**

Test compounds were assayed at 8 concentrations in triplicate. Serial 10-fold dilutions in 100% DMSO were made at a 100-times higher concentration than the final concentration and then diluted with a 2 step protocol in assay buffer to reach the required assay concentrations and 1% DMSO.

The specific compounds exemplified below were categorized by the following potency ranges (IC$_{50}$ values):

A: < 100 nM; B: > 100 nM to 500 nM; C: > 500 nM to 5000 nM.

**Caco-2 permeability assay**

The Caco-2 Permeability assay uses an established method for predicting the in vivo absorption of drugs across the gut wall by measuring the rate of transport of a compound across the Caco-2 cell line.

The Caco-2 cell line is derived from a human colon carcinoma. These cells have characteristics that resemble intestinal epithelial cells such as the formation of a polarised monolayer, well-defined brush border on the apical surface and intercellular junctions.
Assessing transport in both directions (apical to basolateral (A-B) and basolateral to apical (B-A)) across the cell monolayer enables an efflux ratio to be determined which provides an indicator as to whether a compound undergoes active efflux.

Studying the permeability of compounds across a Caco-2 cell monolayer is widely accepted as an established in vitro model to screen for oral absorption and to evaluate the mechanism of transport. Using LC-MS/MS for the analysis of samples derived from Caco-2 cell studies allows the rapid and accurate determination of drug transport across the Caco-2 cell monolayer. (Wang Z, Hop C.E., Leung K.H. and Pang J. (2000) J Mass Spectrom 35 (1); 71-6).

Preferred compounds of Formula (I) have Caco-2 efflux ratios of ≤ 3.0.

Compound Naming

All compounds are named using ACD Labs 10.0 naming software which conforms to IUPAC naming protocols. Some compounds are isolated as TFA salts, which is not reflected by the chemical name. Within the meaning of the present invention the chemical name represents the compound in neutral form as well as its TFA salt or any other salt, especially pharmaceutically acceptable salt, if applicable.

Saturated NaHCO₃ (80 ml) was added in four portions and the biphasic mixture stirred at 20 to 25 °C for ca. 1 h. The organic layer was separated, washed with water (20 ml) and the aqueous phase back extracted at pH 9 with DCM (20 ml). The combined organic phases were dried (Na₂SO₄), filtered and concentrated in vacuo to provide the title compound as yellow oil (6.1 g, 96%).
