Description

The present invention relates to a means for wiping off visors attached to helmets.

During motor-cycling on highways the presently by far most common type of helmet used is the so called integral helmet. Helmets of this type cover practically the entire head. In the front part there is an opening exposing approximately half of the face. As a protection against e.g. wind and insects etc., it is common to fasten a visor covering this opening. This visor also protects against rain. but of course the view is very negatively influenced by the water accumulating on the visor. In order to do something about this it has been common to provide motor-cyclists' gloves with a portion of the upper side, comprised of chamois-leather or similar material, by means of which the driver wipes off the surface of the visor. However, this solution is far from satisfactory, since it is impossible to achieve a complete wiping-off of the visor. From a traffic security point of view it is of course of great importance that a motor-cyclist has a good view, and the deteriorated view during rainy weather results in that one is reluctant to go by motorbike at such occasions, and that one often has to wait until rain ceases before one can continue the trip. Going by motorbike despite rainy weather, thus means that one exposes both oneself and other road users to danger.

The present invention has as an object to provide a glove by means of which the above mentioned disadvantages are eliminated. This object is achieved with a device of the kind disclosed in the appended patent claims.

The preferred embodiment of the invention will be described below with reference to the appended drawing. In the drawing is shown a conventional motor-cyclist's glove 1, in which a thin, flexible ledge 2 is sewn into a seam 3, said seam extending from the tip of the thumb 4, along the side opposite the corner 5 defined by the index finger and the thumb. The wiping-off of the visor is achieved by simply moving the thumb of the glove with its ledge 2 pressed against the visor, back and forth over the surface. One could expect that it would be difficult to achieve an even wiping of the surface with a flexible ledge being attached to the glove in this way, but practical tests have shown that result is beyond expectation. Thus a completely wiped surface can be obtained by moving the glove back and forth just once.

It is obvious that the invention will find application even in other areas than motor-cycling. Thereby the ledge can be given another design and it can also be placed on other locations on the glove.

Claims

1. Glove (1) for wiping off rain, mist or the like from the visor of a helmet of e.g. integral type, characterized in that it comprises a ledge (2) of flexible material, said ledge being provided on the glove (1) in such a way that a person carrying the glove achieves said wiping-off by pressing the ledge against the visor, and moving said ledge back and forth over the visor.

2. Glove according to claim 1, characterized in that the ledge (2) is provided alongside one of the fingers of the glove.

3. Glove according to claim 1 or 2, characterized in that the ledge (2) is provided on the thumb (4) of the glove, on the side opposite the corner (5) defined by the index finger and the thumb, and in the longitudinal direction of the thumb.

4. Glove according to claim 1, characterized in that the ledge (2) is provided across the knuckles of the glove.

Patentansprüche

1. Handschuh (1) zum Abwischen von Regen, Beschlag od.dgl. vom Visier eines Helmes, beispielsweise eines Vollvisier- helmes, dadurch gekennzeichnet, daß er eine Leiste (2) aus flexiblem Material aufweist, wobei die Leiste derart am Handschuh (1) angeordnet ist, daß eine den Handschuh tragende Person das Abwischen durch ein Anpressen der Leiste an das Visier und eine Hinund Herbewegung der Leiste über das Visier vornimmt.

2. Handschuh nach Anspruch 1, dadurch gekennzeichnet, daß die Leiste (2) längs eines der Finger des Handschuhs angeordnet ist.

3. Handschuh nach Anspruch 1 oder 2, dadurch gekennzeichnet, daß die Leiste (2) am Daumen (4) des Handschuhs an der der durch den Zeigefinger und den Daumen definierten Ecke (5) gegenüberliegenden Seite und in Längsrichtung des Daumens angeordnet ist.

4. Handschuh nach Anspruch 1, dadurch gekennzeichnet, daß die Leiste (2) über den Knöcheln am Handschuh angeordnet ist.

Revendications

1. Gant (1) pour essuyer la pluie, la buée ou autre de sur la visière d'un casque par exemple du type intégral, caractérisé en ce qu'il comporte une lame (2) en matériau flexible, ladite lame étant prévue sur le gant (1) de telle sorte qu'une personne qui porte le gant effectue ledit essuyage en pressant la lame contre la visière et en déplaçant ladite lame en va et vient sur la visière.

2. Gant selon la revendication 1 caractérisé en ce que la lame (2) est prévue le long d'un des doigts du gant.

3. Gant selon les revendications 1 ou 2 caractérisé en ce que la lame (2) est prévue sur le pouce (4) du gant, du côté opposé au coin (5) défini par l'index et le pouce, et dans la direction longitudinale du pouce.

4. Gant selon la revendication 1, caractérisé en ce que la lame (2) est prévue à travers les jointures du gant.
