UNITED STATES PATENT OFFICE.

ALBERT L. TALCOTT, OF BOSTON, MASSACHUSETTS, ASSIGNOR TO FREDERIC ROBBINS, OF SAME PLACE.

COMBINATION POCKET-CASE.

SPECIFICATION forming part of Letters Patent No. 286,650, dated October 16, 1883.

Application filed May 26, 1883. (No model.)

To all whom it may concern:

Be it known that I, ALBERT L. TALCOTT, of Boston, in the county of Suffolk and State of Massachusetts, have invented certain new and useful Improvements in Combination Pocket-Cases, of which the following is a specification.

The object of my invention is to provide a cheap, simple, and convenient pocket-case for holding matches, car-tickets, postage-stamps, or similar small articles, each having a separate receptacle or pocket, and also containing an erasable tablet, a railway time-table, and a calendar, all being detachable and changeable; and it consists in the construction, combination, and arrangement of the several parts of the device, as hereinafter more fully described, and set forth in the claim.

Figure 1 represents a perspective view, showing my invention in an open position. Fig. 2 represents a longitudinal section through the same in a closed position. Fig. 3 represents a cross-section of one side portion containing a match-case or other similar receptacle. Fig. 4 represents an elevation of the opposite side portion, containing receptacle for postage-stamps or horse-car tickets.

A represents one of the outer side portions, having near its end a "car-ticket" pocket, B, and upon its opposite or inward side portion a "postage-stamp" pocket, C, while the opposite side portion, A', has a "match-receptacle," D, which is retained expanded or open by means of a curved metal plate, E, fitted between the outside material and the lining thereof, and having scroll-edges, over which the material forming the inward face of

the match-receptacle D passes, the mouth or opening of which is constructed and arranged near the middle or back folding portion of the said side portions, A and A', as shown. The inward lining forming that portion of the match-receptacle D is stitched around its edges to the outside material, leaving a space between it and said outside forming a pocket or receptacle, F, the mouth of which is located opposite the mouth of the said match pocket or receptacle D, and into which is inserted the several detachable slips of paper or card-board forming the railroad time-table H, the erasable tablet L, and calendar P, and a "match-igniting tablet" may also be introduced, if found desirable, the said postage-stamp pocket C being secured upon the inward face of the said lining which forms the said railroad-ticket receptacle, as shown.

Having thus described my invention, what I claim is—

As an improved article of manufacture, the pocket-case consisting of the side portion A, having a car-ticket pocket, B, and a postage-stamp pocket, C, upon opposite sides thereof, and the side portion A', having the match-receptacle D, provided with the curved metal plate E, having scroll-edges, and the pocket F, having the detachable time-table H, calendar P, and erasable tablet L, constructed substantially as described, as and for the purposes set forth.

ALBERT L. TALCOTT.
