Patents Act 1952

CONVENTION APPLICATION FOR A STANDARD PATENT

X/WE, YEDA RESEARCH AND DEVELOPMENT CO. LTD of P.O. Box 95 Rehovot 76100 Israel

hereby apply for the grant of a Standard Patent for an invention entitled:

"CLOUD SEEDING"

.which is described in the accompanying complete specification.

This application is made under the provision of Part XVI of the • Patents Act 1952 and is based on an application for a patent or similar protection made

in Israel Israel

DECLARATION IN SUPPORT

In support of the (Convention) Application made by:

Yeda Research	and	Development	Co.	Ltd.,	P.O.	Box	95,	Rehovot	76100,	Israel
for a patent for an in	avent	ion entitled:								

for a patent for an invention entitled:
CLOUD SEEDING
I (We) Azriel Kadim Yeda Research and Development Co. Ltd.
of and care of the applicant company do solemnly and sincerely declare as follows:
a) Lam (We are) the applicant(s) for the patent- or
b) I am (We are) authorised by the applicant(s) for the patent to make this declaration on its behalf.
Delete the following if not a Convention Application. The basic application(s) as defined by section 141 (142) of the Act was (were) made
on January 15, 1990 in Israel
on November 29, 1990 in Israel
on in
by YEDA RESEARCH AND DEVELOPMENT COMPANY LIMITED
The basic application(s) referred to in this paragraph is (are) the first application(s) made in a Convention country in respect of the invention the subject of the application.
а) ХЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖЖ
or Ronit Popovitz-Biro, 9 Bar Shaul Street, Rehovot, Israel Michal Gavish, 65 Ben Eliezer Street, Ramat Gan, Israel Leslie Leiserowitz, 8 Neve Metz, The Weizmann Institute of Science, Rehovot,
Meir Lahav, 31 Meonot Shine, The Weizmann Institute of Sciencem Rehovot is (are) the actual inventor(s) of the invention and the facts upon which
the applicant is (are) entitled to make the application are as follows: by assignment dated January 22, 1990., the applicant is the assignee of the invention from the said actual inventors.
Declared at Rehovot this 8th day of January 1991
Yeda Research & Development Co. Ltd.
Signed Status General Manager
Declarant's Name Azriel Kadim

(57) Claim

1. A method for inducing nucleation of ice at temperatures within the range from -8°C to 0°C, from supercooled water present as small drops and/or in the vapour state, which comprises contacting supercooled water with an aliphatic long-chain alcohol of the formula:

or

$$H_3C-(CH_2)_m-R-(CH_2)_p-OH$$

where n > 14 and m + p > 14 and R is an unsaturated radical, an heteroatom, carbonyl or carbonyloxy.

5. A method for augmenting rainfall which comprises seeding supercooled clouds with an alcohol of the formula:

$$C_nH_{2n+1}OH$$
 or

$$^{\rm H_3C-(CH_2)_{m}-R-(CH_2)_{p}-OH}$$

where n \rangle 14 and m + p \rangle 14 and R is an unsaturated radical, an heteroatom, carbonyl or carbonyloxy.

Complete Specification for the invention entitled:

"CLOUD SEEDING"

The following statement is a full description of this invention including the best method of performing it known to us/me:-

The invention relates to the augmentation of rainfall and to means for obtaining such effect. The invention is based on the dissemination in the atmosphere of finely divided water-insoluble long chain alcohols which elevate the ice-nucleating threshold temperature.

5

10

15

20

25

Antifreeze molecules - whether in the bloodstreams of fish in polar waters or in the gasoline tanks of automobiles - prevent ice from forming by interfering with crystal formation; a liquid containing an antifreeze can freeze only when it has been chilled to a temperature lower than its normal freezing point. Nucleators have the opposite effect: They promote the formation of ice. The induction or inhibition of crystal formation is important in both biological systems (how frost bacteria destroy crops) and in the nonbiologic (how rain clouds might be seeded).

Pure water can be supercooled to temperatures of -20°C to -40°C. Promotion of ice nucleation, necessary for rainfall, has been exploited in the induced precipitation of rain by silver iodide seeded in clouds. Silver iodide is used today as an artificial rain nucleating system. It increases ice nucleation temperature by about 5°C, resulting in an increase of about 20% of the precipitation in a given region.

There is a continuous search for better materials that can be used as cloud seeding agents. Some crystalline organic substances (Parungo et al., J. Atmos. Sci, 24: 274 (1967) and certain bacteria (Levin et al., J. Climate and Appl. Meteorology, 26: 1188 (1987) were found to nucleate ice

efficiently as silver iodide.

It was now found that the spreading of monolayers of water insoluble alcohols on small water drops, raises the freezing point of these in a significant manner and reduces the supercooling to a larger extent than the hitherto used means for nucleating ice formation.

The present invention relates to the use of aliphatic long-chain alcohols of the formula

 $C_nH_{2n+1}OH$ or

10 $H_3C-(CH_2)_m-R-(CH_2)_p-OH$

where n > 14 and m + p > 14 and R is an unsaturated radical, an heteroatom, carbonyl or carbonyloxy, to induce nucleation of ice at temperatures within the range from -8° C to 0° C, from supercooled water present as small drops and/or in the vapour state. In particular, the invention relates to the use of said alcohols for cloud seeding for augmenting rainfall.

In a preferred embodiment, alcohols of the formula $C_nH_{2n+1}OH$ are used when <u>n</u> is an odd number. Preferably, <u>n</u> is 27, 29 or 31 when nucleation of ice is induced at temperatures from about -2.7°C to about 0°C. The most preferred alcohol is $C_{31}H_{63}OH$.

The invention further relates to a method for augmenting rainfall which comprises seeding supercooled clouds with an alcohol as defined above.

The alcohols of the invention can have both antifreeze and nucleating effects depending on whether they mix into the solution or form surface monolayers. At the monolayer-solution interface, hexagonal ice crystals and hexagonal OH

groups from the alcohol apparently fit nicely together; this promotes ice formation and oriented crystal growth. The raised freezing point was sensitive to the length of the alcohol chain, the number (even or odd) of carbon atoms in the chain and the percentage of the surface of the liquid droplet that was covered by the nucleating alcohol. The temperature elevation of ice nucleation obtained by the monolayer systems of the invention is about 10°C in comparison to only 5°C for silver iodide. The amphiphilic alcohols are also biodegradable, are cheaper and have to be used in minute quantities.

5

1.0

15

20

25

In the experiments of the invention, the freezing point measurements were carried out on two water drops of the same size (ranging from 10 to 40 μ l) placed on a cooling stage in a box purged by cooled nitrogen gas. One drop was completely covered with a monolayer of the amphiphilic chain alcohol and the other with a reference material, such as the corresponding long chain fatty acid. In this way the effect of all factors responsible for induction of nucleation, other than a difference in structural match, are eliminated.

The samples were cooled at a rate of ~1°C/min. The temperature of the drops was measured by a thermocouple. The melting point of ice was used for its calibration. The freezing points were observed by a light microscope. Temperatures of freezing were determined in comparative experiments carried out simultaneously for two different materials. The various amphiphiles can be divided into three categories: (a) the reference materials have the lowest ice

nucleation temperature; (b) the aliphatic alcohols show an increasing order of nucleation efficiency with the increase in chain length, and (c) the alcohols with larger areas per molecule are poor nucleators.

EXAMPLES

5

10

15

20

25

The water drops $(10\mu l)$ were placed on a cooled stage under an optical microscope. One of the drops was covered by 0.5 μl of the alcohol in chloroform. The second drop was covered in a similar way by a reference amphiphilic material. The solvent was allowed to evaporate. The system was purged with nitrogen and cooled down at a rate of about 1°C/min. The freezing point observed for both drops was determined. The freezing point of the drop covered with the reference material was at a lower temperature.

The results are shown in Table I.

The results of the freezing point measurements showed that aliphatic chain alcohols nucleate ice at higher temperatures, and with greater reproducibility, than the analogous carboxylic acids. The freezing point of drops of pure water, by way of comparison, ranged from -20°C to -25°C.

It is striking that the freezing point is so sensitive to the length and parity of the chain of the allohol $C_nH_{2n+1}OH$. The freezing point curve for the <u>n</u>-odd series increases asymptotically with chain length, approaching 0°C for <u>n</u>=31. The <u>n</u>-even series behaves differently; the freezing point curve reaches a plateau of about -8°C for <u>n</u> in the range of 22 to 30. This trend suggests that just prior to ice nucleation, the orientation of the OH groups in the odd and

even analogues are not the same, the former having a structural fit closer to the structure of the lattice of ice.

According to the invention, a suitable preparation of the long-chain aliphatic alcohols, e.g., an emulsion, is brought in contact with supercooled clouds in order to induce nucleation and increase rainfall. The dynamic method of cloud seeding whereby the material is seeded on the upper supercooled part of the cloud in increased concentrations is suitable for this purpose. The material may be dispersed in the clouds in a finely dispersed form. It may be applied as a fog released from a high altitude.

10

TABLE I

	Example	Alcohol/Freezing Point	Molarity	Reference/Freezing Point
	1	C30H61OH/7.5±0.5°C	6.6x10-4M	C29H59COOH/-15.8±1.6°C
15	2	C31H63OH/-0.5±0.5°C	5.5x10-4M	C29H59COOH/-15.8±1.6°C
	3	C21H43OH/-5.3±1.4°C	4.8x10-4M	C20H41COOH/-17.3±1.0°C
	4	C29H59OH/-1.4±1.0°C	5.0x10-4M	C28H57COOH/-12.8±1.5°C
	5	C27H55OH/-2.2±0.5°C	5.2x10-4M	C24H49COOH/-15.3±1.5°C
	6	C25H51OH/-3.4±1.0°C	5.0x10-4M	C24H49COOH/-15.3±1.5°C
20	7	C22H45OH/-7.9±0.5°C	5.0x10-4M	C21H43COOH/-14.0±1.0°C

THE CLAIMS DEFINING THE INVENTION ARE AS FOLLOWS:-

- 1. A method for inducing nucleation of ice at temperatures within the range from $-8^{\circ}C$ to $0^{\circ}C$, from supercolled water present as small drops and/or in the
- vapour state, which comprises contacting supercooled water with an aliphatic long-chain alcohol of the formula:

$$C_nH_{2n+1}OH$$
 or

10
$$H_3C-(CH_2)_m-R-(CH_2)_p-OH$$

where n > 14 and m + p > 14 and R is an unsaturated radical, an heteroatom, carbonyl or carbonyloxy.

- 15 2. A method according to claim 1 wherein the alcohol has the formula $C_nH_{2n+1}OH$ and n is an odd number.
 - 3. A method according to claim 2 wherein n is 27, 29 or 31.
- 4. A method according to claim 2 wherein the alcohol is 20 $^{\rm C}_{31}{}^{\rm H}_{63}{}^{\rm OH}$.
 - 5. A method for augmenting rainfall which comprises seeding supercooled clouds with an alcohol of the formula:

$$C_n^H_{2n+1}^OH$$
 or

 $H_3C-(CH_2)_m-R-(CH_2)_p-OH$

where n \rangle 14 and m + p \rangle 14 and R is an unsaturated radical, an heteroatom, carbonyl or

- 30 carbonyloxy.
 - 6. A method according to claim 5 wherein the alcohol has the formula $C_nH_{2n+1}OH$ and n is an odd number.
 - 7. A method according to claim 6 wherein n is 27, 29 or 31.

25

8. A method according to claim 7 wherein the alcohol is $^{\rm C}31^{\rm H}63^{\rm OH}.$
