Title: IMPROVED COLOR IN TITANIUM CATALYZED POLYESTERS

Abstract: Described as one aspect of the invention are polyesters comprising (a) a dicarboxylic acid component comprising: (i) 70 to 100 mole % of terephthalic acid residues; (ii) 0 to 30 mole % of aromatic dicarboxylic acid residues having up to 20 carbon atoms; and (iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues having up to 16 carbon atoms; and (b) a glycol component comprising: (i) about 10 to about 90 mole % of ethylene glycol residues; and (ii) about 90 to about 10 mole % of cyclohexanediol residues; (II) residues of at least one titanium compound; and (III) at least one chelating phosphorus species, reaction products thereof, or mixtures thereof, represented by the structure (II), wherein: n= is an integer from 1 to 4; R can be hydrogen or C1-C12-alkyl; and R1 and R2 each can be hydrogen, C1-C12-alkyl, hydroxyl, or aryl; wherein the total mole% of the dicarboxylic acid component is 100 mole%; wherein the total mole% of the glycol component is 100 mole%; and wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25 g/50 ml at 25°C.
IMPROVED COLOR IN TITANIUM CATALYZED POLYESTERS

FIELD OF THE INVENTION
[0001] The present invention generally relates to polyester compositions made from terephthalic acid, or an ester thereof, and mixtures thereof, ethylene glycol, and cyclohexanedicarboxylic acid, and a compound containing at least one chelating phosphorus species and/or reaction products thereof.

BACKGROUND OF THE INVENTION
[0002] Glycol modified PET (PETG), a polyester based solely on terephthalic acid (TPA) or an ester thereof, ethylene glycol, and cyclohexanedicarboxylic acid, is known in the art and is commercially available.
[0003] PETG is sometimes produced with a catalyst/stabilizer system which, given the rates at which polymer is produced, yields a polymer that barely meets color specifications. If color formation increases further, however, the polymer has lower value. In order to assure good color formation, a high purity terephthalic acid is sometimes used. The production of this high purity TPA adds significant cost to the process as a whole.
[0004] Thus, there is a need in the art for a system which produces PETG copolyesters with less color than the current catalyst/stabilizer system.

SUMMARY OF THE INVENTION
[0005] It is believed that certain polyester compositions comprising terephthalic acid, an ester thereof, and/or mixtures thereof, cyclohexanedicarboxylic acid, and ethylene glycol, further comprising at least one chelating phosphorus species and/or reaction products thereof, are superior to polyesters known in the art with respect to good color and/or clarity.
[0006] In one aspect, the invention provides a polyester composition comprising:

(I) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:
(i) 70 to 100 mole % of terephthalic acid residues;
(ii) 0 to 30 mole % of aromatic dicarboxylic acid residues
    having up to 20 carbon atoms; and
(iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues
    having up to 16 carbon atoms; and
(b) a glycol component comprising:
   (i) about 10 to about 90 mole % of ethylene glycol
       residues; and
   (ii) about 90 to about 10 mole % of
cyclohexanedimethanol residues;
(III) residues of at least one titanium compound; and
(II) at least one chelating phosphorus species, reaction products
     thereof, or mixtures thereof, represented by the structure:

\[
\begin{array}{c}
\text{RO} \\
\text{P} \\
\text{OR} \\
\text{RO} \\
\text{P} \\
\text{OR} \\
\text{R}_1 \\
\text{R}_2 \\
n
\end{array}
\]

wherein:
   \( n \) = an integer from 1 to 4;
   \( R \) can be hydrogen or \( \text{C}_1\text{-C}_2\)-alkyl; and
   \( R_1 \) and \( R_2 \) each can be hydrogen, \( \text{C}_1\text{-C}_2\)-alkyl, hydroxyl, or aryl;
wherein the total mole% of the dicarboxylic acid component is 100 mole%,
wherein the total mole% of the glycol component is 100 mole%; and
wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as
determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25
g/50 ml at 25°C.

[0007] In one aspect, the invention provides a polyester composition
comprising:
(I) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:
   (i) 70 to 100 mole % of terephthalic acid residues;
   (ii) 0 to 30 mole % of aromatic dicarboxylic acid residues having up to 20 carbon atoms; and
   (iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues having up to 16 carbon atoms; and
(b) a glycol component comprising:
   (i) about 20 to about 80 mole % of ethylene glycol residues; and
   (ii) about 20 to about 80 mole % of cyclohexanediethanol residues;

(II) residues of at least one titanium compound; and

(III) at least one chelating phosphorus species, reaction products thereof, or mixtures thereof, represented by the structure:

```
RO P O
\    \  /  \\
\    \ /   \\
\    / \   \\
R1   P O  OR
    \ cone  \\
    \     \\
    /     \\
R2     OR
```

wherein:

- n = an integer from 1 to 4;
- R can be hydrogen or C-1-C<sub>2</sub>-alkyl; and
- R<sub>1</sub> and R<sub>2</sub> each can be hydrogen, C<sub>-1</sub>-C<sub>2</sub>-alkyl, hydroxyl, or aryl;

wherein the total mole% of the dicarboxylic acid component is 100 mole%, wherein the total mole% of the glycol component is 100 mole%; and wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25 g/50 ml at 25°C.
[0008] In one aspect, the invention provides a polyester composition comprising:

(I) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:
(i) 70 to 100 mole % of terephthalic acid residues;
(ii) 0 to 30 mole % of aromatic dicarboxylic acid residues having up to 20 carbon atoms; and
(iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues having up to 16 carbon atoms; and

(b) a glycol component comprising:
(i) greater than about 50 mole % of ethylene glycol residues; and
(ii) less than about 50 mole % of cyclohexanediol residues;

(II) residues of at least one titanium compound; and

(III) at least one chelating phosphorus species, reaction products thereof, or mixtures thereof, represented by the structure:

```
  O
 R  P  O
    |   |
    R1 R2
```

wherein:

- $n$ is an integer from 1 to 4;
- $R$ can be hydrogen or CrC$_2$-alkyl; and
- $R_1$ and $R_2$ each can be hydrogen, C$_1$-C$_2$-alkyl, hydroxyl, or aryl;

wherein the total mole% of the dicarboxylic acid component is 100 mole%,

wherein the total mole% of the glycol component is 100 mole%; and
wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as determined in 60/40 (wt/wt) phenol/tetrachloroethane at a concentration of 0.25 g/50 ml at 25°C.

[0009] In one aspect, the invention provides a polyester composition comprising:

(I) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:
   (i) 70 to 100 mole % of terephthalic acid residues;
   (ii) 0 to 30 mole % of aromatic dicarboxylic acid residues having up to 20 carbon atoms; and
   (iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues having up to 16 carbon atoms; and

(b) a glycol component comprising:
   (i) about 40 to about 80 mole % of ethylene glycol residues; and
   (ii) about 20 to about 60 mole % of cyclohexanediol residues;

(II) residues of at least one titanium compound; and

(III) at least one chelating phosphorus species, reaction products thereof, or mixtures thereof, represented by the structure:

\[
\begin{align*}
\text{RO} & \quad \text{P} \quad \text{OR} \\
\text{RO} & \quad \text{P} \quad \text{OR} \\
\text{R}_1 & \quad \text{R}_2 \quad \text{n}
\end{align*}
\]

wherein:

\[ n = \text{an integer from 1 to 4}; \]

R can be hydrogen or \(^{\text{C-i-C}_2\text{-alkyl}}\); and

R\(^1\) and R\(^2\) each can be hydrogen, \(^{\text{C-i-C}_2\text{-alkyl}}\), hydroxyl, or aryl;
wherein the total mole% of the dicarboxylic acid component is 100 mole%,
wherein the total mole% of the glycol component is 100 mole%; and
wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as
determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25
g/50 ml at 25°C.

[0010] In one aspect, the invention provides a polyester composition
comprising:

(I) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:
   (i) 70 to 100 mole % of terephthalic acid residues;
   (ii) 0 to 30 mole % of aromatic dicarboxylic acid residues
        having up to 20 carbon atoms; and
   (iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues
        having up to 16 carbon atoms; and
(b) a glycol component comprising:
   (i) about 60 to about 80 mole % of ethylene glycol
       residues; and
   (ii) about 20 to about 40 mole % of
        cyclohexanediol residues;

(II) residues of at least one titanium compound; and

(III) at least one chelating phosphorus species, reaction products
      thereof, or mixtures thereof, represented by the structure:

\[
\begin{align*}
&\text{RO-P-OR} \\
&\text{RO-POR} \\
&\text{R}_1 \quad \text{R}_2 \\
&\text{R}_3 \quad \text{R}_4
\end{align*}
\]

wherein:

\( n = \text{an integer from 1 to 4}; \)
R can be hydrogen or C$_{1-2}$-alkyl; 

$R_1$ and $R_2$ each can be hydrogen, C$_{1-2}$-alkyl, hydroxyl, or aryl;

wherein the total mole% of the dicarboxylic acid component is 100 mole%,
wherein the total mole% of the glycol component is 100 mole%; and
wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as
determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25 g/50 ml at 25°C.

In one aspect, the invention provides a polyester composition comprising:

(I) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:

(i) 70 to 100 mole % of terephthalic acid residues;
(ii) 0 to 30 mole % of aromatic dicarboxylic acid residues
having up to 20 carbon atoms; and
(iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues
having up to 16 carbon atoms; and

(b) a glycol component comprising:

(i) about 60 to about 75 mole % of ethylene glycol
residues; and
(ii) about 25 to about 40 mole % of
cyclohexanediethanol residues;

(II) residues of at least one titanium compound; and

(III) at least one chelating phosphorus species, reaction products
thereof, or mixtures thereof, represented by the structure:
wherein:

n = an integer from 1 to 4;
R can be hydrogen or C-i-C\textsubscript{2}-alkyl; and
R\textsubscript{1} and R\textsubscript{2} each can be hydrogen, C-i-C\textsubscript{2}-alkyl, hydroxyl, or aryl;

wherein the total mole\% of the dicarboxylic acid component is 100 mole\%,
wherein the total mole\% of the glycol component is 100 mole\%; and
wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25 g/50 ml at 25°C.

[0012] In one aspect, the invention provides a polyester composition comprising:

(I) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:

(i) 70 to 100 mole \% of terephthalic acid residues;
(ii) 0 to 30 mole \% of aromatic dicarboxylic acid residues having up to 20 carbon atoms; and
(iii) 0 to 10 mole \% of aliphatic dicarboxylic acid residues having up to 16 carbon atoms; and

(b) a glycol component comprising:

(i) about 10 to about 90 mole \% of ethylene glycol residues; and
(ii) about 10 to about 90 mole \% of cyclohexanediol residues;

(II) residues of at least one titanium compound; and

(III) at least one chelating phosphorus species, reaction products thereof, or mixtures thereof, represented by the structure:
wherein:

\( n \) = an integer from 1 to 4; 

R is hydrogen; and 

R\(_1\) and R\(_2\) each can be hydrogen, \( \text{C-i-C}_2 \) -alkyl, hydroxyl, or aryl; wherein the total mole\% of the dicarboxylic acid component is 100 mole\%, wherein the total mole\% of the glycol component is 100 mole\%; and wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25 g/50 ml at 25°C.

In one aspect, the invention provides a polyester composition comprising:

(I) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:

(i) 70 to 100 mole \% of terephthalic acid residues;

(ii) 0 to 30 mole \% of aromatic dicarboxylic acid residues having up to 20 carbon atoms; and

(iii) 0 to 10 mole \% of aliphatic dicarboxylic acid residues having up to 16 carbon atoms; and

(b) a glycol component comprising:

(i) about 20 to about 80 mole \% of ethylene glycol residues; and

(I) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:
   (i) 70 to 100 mole \% of terephthalic acid residues;
   (ii) 0 to 30 mole \% of aromatic dicarboxylic acid residues having up to 20 carbon atoms; and
   (iii) 0 to 10 mole \% of aliphatic dicarboxylic acid residues having up to 16 carbon atoms; and
(b) a glycol component comprising:
   (i) about 60 to about 80 mole \% of ethylene glycol residues; and
   (ii) about 20 to about 40 mole \% of cyclohexanediol residues;

(II) residues of at least one titanium compound; and

(III) at least one chelating phosphorus species, reaction products thereof, or mixtures thereof, represented by the structure:
wherein:

\[ n = \text{an integer from 1 to 4}; \]

R can be hydrogen or C-i-C_2-alkyl; and

\[ R_1 \text{ is hydroxyl; and } R_2 \text{ can be hydrogen, C-i-C_2-alkyl, hydroxyl, or aryl;} \]

wherein the total mole% of the dicarboxylic acid component is 100 mole%,
wherein the total mole% of the glycol component is 100 mole%; and
wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as
determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25
g/50 ml at 25°C.

[0023] In one aspect, the invention provides

In one aspect, the invention provides a polyester composition comprising:

(I) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:

   (i) 70 to 100 mole % of terephthalic acid residues;

   (ii) 0 to 30 mole % of aromatic dicarboxylic acid residues
        having up to 20 carbon atoms; and

   (iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues
        having up to 16 carbon atoms; and

(b) a glycol component comprising:

   (i) greater than about 50 mole % of ethylene glycol
        residues; and

   (ii) less than about 50 mole % of cyclohexanediethanol
        residues;

(II) residues of at least one titanium compound; and
(III) at least one chelating phosphorus species, reaction products thereof, or mixtures thereof, represented by the structure:

\[
\begin{align*}
& \text{RO} \quad \text{P} \quad \text{OR} \\
& \text{RO} \quad \text{P} \quad \text{OR} \\
& \text{R}_1 \quad \text{R}_2 \\
\end{align*}
\]

wherein:
- \( n \) = an integer from 1 to 4;
- \( R \) can be hydrogen or \( \text{C}_i\text{-C}_{2^2}\)-alkyl; and
- \( \text{R}_1 \) is hydroxyl; and \( \text{R}_2 \) can be hydrogen, \( \text{C}_i\text{-C}_{2^2}\)-alkyl, hydroxyl, or aryl;

wherein the total mole% of the dicarboxylic acid component is 100 mole%, wherein the total mole% of the glycol component is 100 mole%; and wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25 g/50 ml at 25°C.

[0024] In one aspect, the invention provides a polyester composition comprising:

(l) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:
   (i) 70 to 100 mole % of terephthalic acid residues;
   (ii) 0 to 30 mole % of aromatic dicarboxylic acid residues having up to 20 carbon atoms; and
   (iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues having up to 16 carbon atoms; and

(b) a glycol component comprising:
   (i) about 10 to about 90 mole % of ethylene glycol residues; and
(ii) about 10 to about 90 mole % of cyclohexanediol residues;
(II) residues of at least one titanium compound; and
(III) at least one chelating phosphorus species, reaction products thereof, or mixtures thereof, represented by the structure:

\[
\begin{align*}
\text{RO-P} & \text{O} \\

      R       RO
```

wherein:

n = 1;
R is hydrogen;
R1 is hydroxyl; and
R2 is methyl;

wherein the total mole% of the dicarboxylic acid component is 100 mole%,
wherein the total mole% of the glycol component is 100 mole%; and
wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as
determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25
G/50 ml at 25°C.

[0037] In one aspect, the invention provides in one aspect, the invention
provides a polyester composition comprising:

(I) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:

(i) 70 to 100 mole % of terephthalic acid residues;
(ii) 0 to 30 mole % of aromatic dicarboxylic acid residues
    having up to 20 carbon atoms; and
(iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues
    having up to 16 carbon atoms; and

(b) a glycol component comprising:

(i) about 20 to about 80 mole % of ethylene glycol
    residues; and
(ii) about 20 to about 80 mole % of
    cyclohexanediethanol residues;

(II) residues of at least one titanium compound; and

(III) at least one chelating phosphorus species, reaction products
      thereof, or mixtures thereof, represented by the structure:

\[
\text{wherein:}
\]
n = 1;
R is hydrogen;
R1 is hydroxyl; and
R2 is methyl;

wherein the total mole% of the dicarboxylic acid component is 100 mole%,
wherein the total mole% of the glycol component is 100 mole%; and
wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as
determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25
g/50 ml at 25°C.

[0038] In one aspect, the invention provides a polyester composition comprising:

(i) at least one polyester which comprises:

(a) a dicarboxylic acid component comprising:
   (i) 70 to 100 mole % of terephthalic acid residues;
   (ii) 0 to 30 mole % of aromatic dicarboxylic acid residues
        having up to 20 carbon atoms; and
   (iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues
        having up to 16 carbon atoms; and
(b) a glycol component comprising:
   (i) about 60 to about 80 mole % of ethylene glycol
       residues; and
   (ii) about 20 to about 40 mole % of
        cyclohexanediol residues;
(II) residues of at least one titanium compound; and
(III) at least one chelating phosphorus species, reaction products
      thereof, or mixtures thereof, represented by the structure:
wherein:

\( n = 1 \);

[0045] In certain embodiments of the invention, the titanium catalyst can be either substituted with or supplemented with a metal catalyst which does not contain titanium.
In certain embodiments, the ratios of phosphorus atoms to titanium atoms can be from 1:1 to 5:1.

In certain embodiments, the ratios of phosphorus atoms to titanium atoms can be from 2:1.

In one aspect, any of processes described herein for making the polyester compositions and/or polyesters comprise at least one of the chelating phosphorus species described herein.

In one aspect, the polyester compositions are useful in articles of manufacture including, but not limited to, extruded, calendered, and/or molded articles including, but not limited to, injection molded articles, extruded articles, cast extrusion articles, profile extrusion articles, melt spun articles, thermoformed articles, extrusion molded articles, injection blow molded articles, injection stretch blow molded articles, extrusion blow molded articles and extrusion stretch blow molded articles. These articles can include, but are not limited to, films, bottles, containers, sheet and/or fibers.

In one aspect, the polyester compositions useful in the invention may be used in various types of film and/or sheet, including but not limited to extruded film(s) and/or sheet(s), calendered film(s) and/or sheet(s), compression molded film(s) and/or sheet(s), solution casted film(s) and/or sheet(s). Methods of making film and/or sheet include but are not limited to extrusion, calendering, compression molding, and solution casting.

DETAILED DESCRIPTION OF THE INVENTION

The present invention may be understood more readily by reference to the following detailed description of certain embodiments of the invention and the working examples. In accordance with the purpose(s) of this invention, certain embodiments of the invention are described in the Summary of the Invention and are further described herein below. Also, other embodiments of the invention are described herein.

This invention relates to the use of a chelating phosphorus species in conjunction with a transition metal catalyst species to effect the synthesis of a
polyester. The term "chelating phosphorus species" implies that two or more phosphorus atoms are tethered together by one or more linking atoms and that the geometry of the molecule is such that both phosphorus atoms can coordinate through a P-O-M bond to the catalyst metal used for polymerization, where M is a catalyst metal and, in one embodiment, can be titanium.

[0053] In one embodiment, the chelating phosphorus species is represented by Structure II as follows:

\[ \text{Structure II} \]

wherein:

- \( n \) is an integer from 1 to 4;
- \( R \) can be hydrogen or \( \text{C}_2\text{H}_4\text{-alkyl} \); and
- \( R_1 \) and \( R_2 \) each can be hydrogen, \( \text{C}_2\text{H}_4\text{-alkyl} \), hydroxyl, or aryl.

[0054] In one embodiment, the chelating phosphorus species is represented by Structure I as follows:

\[ \text{Structure I} \]

wherein:

- \( n \) is an integer from 1 to 4; and
- \( R_1 \) and \( R_2 \) each can be hydrogen, \( \text{C}_2\text{H}_4\text{-alkyl} \), hydroxyl, or aryl.
The term "aryl" is used herein to denote an aromatic radical containing 6, 10 or 14 carbon atoms in the conjugated aromatic ring structure and these radicals substituted with one or more groups selected from CrC_6-alkyl; CrC_6-alkoxy; phenyl, and phenyl substituted with C-i-C_6-alkyl; C-i-C_6-alkoxy; halogen and the like; C_3-C_8-cycloalkyl; halogen; hydroxy, cyano, trifluoromethyl and the like. Typical aryl groups can be phenyl, naphthyl, phenylnaphthyl, anthrnyl (anthracenyl) and the like.

The term "C-i-C_22-alkyl", as used herein, denotes a saturated hydrocarbon radical which contains one to twenty-two carbons and which may be straight or branched-chain. Such C1-C22 alkyl groups can be methyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, isopropyl, isobutyl, tertbutyl, neopentyl, 2-ethylheptyl, 2-ethylhexyl, and the like. The term "substituted d-C^-alkyl" refers to C-i-C_22-alkyl radicals as described above which may be substituted with one or more substituents selected from hydroxy, halogen, cyano, aryl, heteroaryl, C_3-C_8-cycloalkyl, substituted C_3-C_8-cycloalkyl, CrC_6-alkoxy, C_2-C_6 alkanoyloxy and the like.

The term "C_3-C_8-cycloalkyl", is used herein to denote a cycloaliphatic hydrocarbon radical containing three to eight carbon atoms. The term "substituted C_3-C_8-cycloalkyl" is used to describe a C_3-C_8-cycloalkyl radical as detailed above containing at least one group selected from CrC_6-alkyl, C-i-C_6-alkoxy, hydroxy, halogen, and the like.

The term "aryl" is used herein to denote an aromatic radical containing 6, 10 or 14 carbon atoms in the conjugated aromatic ring structure and these radicals substituted with one or more groups selected from hydrogen; C-i-C_6-alkyl; Ci-C_6-alkoxy; phenyl, and phenyl substituted with hydrogen; C-i-C_6-alkyl; C_1-C_6-alkoxy; halogen and the like; C_3-C_8-cycloalkyl; halogen; hydroxy, cyano, trifluoromethyl and the like. Typical aryl groups include phenyl, naphthyl, phenylnaphthyl, anthrnyl (anthracenyl) and the like. The term "heteroaryl" is used to describe conjugated cyclic radicals containing at least one hetero atom selected from sulfur, oxygen, nitrogen or a combination of these in combination with from two to about ten carbon atoms and these heteroaryl radicals substituted
with the groups mentioned above as possible substituents on the aryl radical. Typical heteroaryl radicals include: 2- and 3-furyl, 2- and 3-thienyl, 2- and 3-pyrrolyl, 2-, 3-, and 4-pyridyl, benzothiophen-2-yl; benzothiazol-2-yl, benzoazol-2-yl, benzimidazol-2-yl, 1, 3, 4-oxadiazol-2-yl, 1, 3, 4-thiadiazol-2-yl, 1,2,4-thiadiazol-5-yl, isothiazol-5-yl, imidazol-2-yl, quinolyl and the like.

[0059] The terms "Ci-C_6-alkoxy" and "C_2-C_6-alkanoyloxy" are used herein to represent the groups -0-CrC_6-alkyl and -OCOCi-C_6-alkyl, respectively, wherein "C-i-Ce-alkyl" denotes a saturated hydrocarbon that contains 1-6 carbon atoms, which may be straight or branched-chain, and which may be further substituted with one or more groups selected from halogen, methoxy, ethoxy, phenyl, hydroxy, acetyloxy and propionyloxy. The term "halogen" is used to represent fluorine, chlorine, bromine, and iodine; however, chlorine and bromine are preferred.

[0060] The term "C_2-C_2-alkylene" is used herein to denote a divalent hydrocarbon radical that contains from two to twenty-two carbons and which may be straight or branched chain and which may be substituted with one or more substituents selected from hydroxy, halogen, C-i-C_6-alkoxy, C_2-C_6-alkanoyloxy and aryl. The term "C_3-C_8-cycloalkylene" is used herein to denote divalent cycloaliphatic radicals containing three to eight carbon atoms and these are optionally substituted with one or more C-i-C_6-alkyl groups. The term "arylene" is used to denote 1,2-, 1,3-, and 1,4-phenylene radicals and these optionally substituted with CrC_6-alkyl, CrC_6-alkoxy and halogen.

[0061] In one embodiment, the chelating phosphorus species is represented by Structure III as follows:

```
HO      P      O      OH
HO      P      O      OH
HO  CH3
```

Etidronic acid
In one embodiment, the chelating phosphorus species is a dialkyl substituted diphosphinic acid. In another embodiment, the dialkyl substituted diphosphinic acid can be at least one of 1,2-ethylene diphosphonic acid, 1,2-butylene diphosphonic acid, \( P, P'-di(2-ethylhexyl) \) methanediphosphonic acid, \( P, P'-di(2-ethylhexyl)ethanedi phosphonic acid \), and \( P, P'-di(2-ethylhexyl) \) butanedi phosphonic acid.

In one embodiment, ratios of phosphorus atoms to titanium atoms can be from 1:1 to 5:1. In another embodiment, the ratio of phosphorus atoms to titanium atoms is 2:1. Note that a phosphorus to titanium atom ratio of 2:1 implies a phosphorus species to titanium species ratio of 1:1.

In one embodiment, the invention involves the use of dialkyl substituted diphosphonic acid in conjunction with a Ti(IV) catalyst such as titanium tetraisopropoxide, for polyester synthesis, in a ratio appropriate to allow for rapid polymerization but at the same time attenuating polymer color more so than an un-tethered phosphorus compound such as merpol A. Merpol A is a phosphate ester commercially available from Stepan Chemical Co and/or E.I. duPont de Nemours & Co. The CAS Registry number for Merpol A is believed to be CAS Registry # 37208-27-8.

In embodiment, the improvement to color is reduction of yellowness.

The titanium compounds useful in this invention include any compound containing titanium including but not limited to: tetraethyl titanate, titanium tetramethylate, acetyltriisopropyl titanate, tetrapropyl titanate, tetrabutyl titanate, polybutyl titanate, 2-ethylhexyl titanate, octylene glycol titanate, lactate titanate, triethanolamine titanate, acetyl triisopropyl titanate, titanium tetra-isopropylate, acetylacetonate titanate, ethylacetoacetic ester titanate, isostearyl titanate, acetyl triisopropyl titanate, titanium tetraisopropoxide, titanium glycolates, titanium butoxide, hexylene glycol titanate, and tetraisooctyl titanate, titanium dioxide, titanium dioxide/silicon dioxide coprecipitates, and titanium dioxide/zirconium dioxide coprecipitates. This invention includes but is not limited to the titanium dioxide/silicon dioxide coprecipitate catalyst described in United States Patent 6,559,272.
[0067] The polymer compositions consist of terephthalic acid-based copolyesters which contain as major glycol components ethylene glycol and cyclohexane dimethanol, but may also include modifying glycols such as 2,2,4,4-tetramethyl-1,3-cyclobutanediol (TMCD).

[0068] In one embodiment of the invention, the copolyester comprises greater than 50 mole % ethylene glycol and less than 50 mole % 1,4-cyclohexanediol, wherein the total mole % of the dicarboxylic acid component is 100 mole %, and wherein the total mole % of the glycol component is 100 mole %.

[0069] In one embodiment of the invention, the copolyester comprises 10 to 90 mole % ethylene glycol and 10 to 90 mole % 1,4-cyclohexanediol, wherein the total mole % of the dicarboxylic acid component is 100 mole %, and wherein the total mole % of the glycol component is 100 mole %.

[0070] In one embodiment of the invention, the copolyester comprises 20 to 80 mole % ethylene glycol and 20 to 80 mole % 1,4-cyclohexanediol, wherein the total mole % of the dicarboxylic acid component is 100 mole %, and wherein the total mole % of the glycol component is 100 mole %.

[0071] In one embodiment of the invention, the copolyester comprises 40 to 80 mole % ethylene glycol and 20 to 60 mole % 1,4-cyclohexanediol, wherein the total mole % of the dicarboxylic acid component is 100 mole %, and wherein the total mole % of the glycol component is 100 mole %.

[0072] In one embodiment of the invention, the copolyester comprises 50 to 80 mole % ethylene glycol and 20 to 50 mole % 1,4-cyclohexanediol, wherein the total mole % of the dicarboxylic acid component is 100 mole %, and wherein the total mole % of the glycol component is 100 mole %.

[0073] In one embodiment of the invention, the copolyester comprises 60 to 80 mole % ethylene glycol and 20 to 40 mole % 1,4-cyclohexanediol, wherein the total mole % of the dicarboxylic acid component is 100 mole %, and wherein the total mole % of the glycol component is 100 mole %.
In one embodiment of the invention, the copolyester comprises 60 to 75 mole % ethylene glycol and 25 to 40 mole % 1,4-cyclohexanediethanol, wherein the total mole % of the dicarboxylic acid component is 100 mole %, and wherein the total mole % of the glycol component is 100 mole %.

In some of the embodiments of the invention, the polyesters have a unique combination of the properties of good color and good processability. In some embodiments, the polymer lines can be run at faster speeds and/or higher temperatures and still achieve good color.

The term "polyester", as used herein, is intended to include "copolyesters" and is understood to mean a synthetic polymer prepared by the reaction of one or more difunctional carboxylic acids and/or multifunctional carboxylic acids with one or more difunctional hydroxyl compounds and/or multifunctional hydroxyl compounds. Typically the difunctional carboxylic acid can be a dicarboxylic acid and the difunctional hydroxyl compound can be a dihydric alcohol such as, for example, glycols and diols. The term "glycol" as used herein includes, but is not limited to, diols, glycols, and/or multifunctional hydroxyl compounds, for example, branching agents. Alternatively, the difunctional carboxylic acid may be a hydroxy carboxylic acid such as, for example, p-hydroxybenzoic acid, and the difunctional hydroxyl compound may be an aromatic nucleus bearing 2 hydroxyl substituents such as, for example, hydroquinone. The term "residue", as used herein, means any organic structure incorporated into a polymer through a polycondensation and/or an esterification reaction from the corresponding monomer. The term "repeating unit", as used herein, means an organic structure having a dicarboxylic acid residue and a diol residue bonded through a carbonyloxy group. Thus, for example, the dicarboxylic acid residues may be derived from a dicarboxylic acid monomer or its associated acid halides, esters, salts, anhydrides, and/or mixtures thereof.

Furthermore, as used herein, the term "diacid" includes multifunctional acids, for example, branching agents. As used herein, therefore, the term "dicarboxylic acid" is intended to include dicarboxylic acids and any derivative of a dicarboxylic acid, including its associated acid halides, esters, half-esters, salts, half-salts,
anhydrides, mixed anhydrides, and/or mixtures thereof, useful in a reaction process with a diol to make polyester. As used herein, the term "terephthalic acid" is intended to include terephthalic acid itself and residues thereof as well as any derivative of terephthalic acid, including its associated acid halides, esters, half-esters, salts, half-salts, anhydrides, mixed anhydrides, and/or mixtures thereof or residues thereof useful in a reaction process with a diol to make polyester.

The polyesters used in the present invention typically can be prepared from dicarboxylic acids and diols which react in substantially equal proportions and are incorporated into the polyester polymer as their corresponding residues. The polyesters of the present invention, therefore, can contain substantially equal molar proportions of acid residues (100 mole%) and diol (and/or multifunctional hydroxyl compound) residues (100 mole%) such that the total moles of repeating units is equal to 100 mole%. The mole percentages provided in the present disclosure, therefore, may be based on the total moles of acid residues, the total moles of diol residues, or the total moles of repeating units. For example, a polyester containing 30 mole% isophthalic acid, based on the total acid residues, means the polyester contains 30 mole% isophthalic acid residues out of a total of 100 mole% acid residues. Thus, there are 30 moles of isophthalic acid residues among every 100 moles of acid residues. In another example, a polyester containing 30 mole% 1,4-cyclohexanediol, based on the total diol residues, means the polyester contains 30 mole% 1,4-cyclohexanediol residues out of a total of 100 mole% diol residues. Thus, there are 30 moles of 1,4-cyclohexanediol residues among every 100 moles of diol residues.

In other aspects of the invention, the Tg of the polyesters useful in the polyester compositions of the invention can be at least one of the following ranges: 60 to 200 °C; 60 to 190 °C; 60 to 180 °C; 60 to 170 °C; 60 to 160 °C; 60 to 155 °C; 60 to 150 °C; 60 to 145 °C; 60 to 140 °C; 60 to 138 °C; 60 to 135 °C; 60 to 130 °C; 60 to 125 °C; 60 to 120 °C; 60 to 115 °C; 60 to 110 °C; 60 to 105 °C; 60 to 100 °C; 60 to 95 °C; 60 to 90 °C; 60 to 85 °C; 60 to 80 °C; 60 to 75 °C; 65 to 200 °C; 65 to 190 °C; 65 to 180 °C; 65 to 170 °C; 65 to 160 °C; 65 to 155 °C; 65 to 150 °C;
65 to 145°C; 65 to 140°C; 65 to 138°C; 65 to 135°C; 65 to 130°C; 65 to 125°C; 65 to 120°C; 65 to 115°C; 65 to 110°C; 65 to 105°C; 65 to 100°C; 65 to 95°C; 65 to 90°C; 65 to 85°C; 65 to 80°C; 65 to 75°C; 70 to 200°C; 70 to 190°C; 70 to 180°C; 70 to 170°C; 70 to 160°C; 70 to 155°C; 70 to 150°C; 70 to 145°C; 70 to 140°C; 70 to 138°C; 70 to 135°C; 70 to 130°C; 70 to 125°C; 70 to 120°C; 70 to 115°C; 70 to 110°C; 70 to 105°C; 70 to 100°C; 70 to 95°C; 70 to 90°C; 70 to 85°C; 70 to 80°C; 70 to 75°C; 75 to 200°C; 75 to 190°C; 75 to 180°C; 75 to 170°C; 75 to 160°C; 75 to 155°C; 75 to 150°C; 75 to 145°C; 75 to 140°C; 75 to 138°C; 75 to 135°C; 75 to 130°C; 75 to 125°C; 75 to 120°C; 75 to 115°C; 75 to 110°C; 75 to 105°C; 75 to 100°C; 75 to 95°C; 75 to 90°C; 75 to 85°C; 75 to 80°C; 80 to 200°C; 80 to 190°C; 80 to 180°C; 80 to 170°C; 80 to 160°C; 80 to 155°C; 80 to 150°C; 80 to 145°C; 80 to 140°C; 80 to 138°C; 80 to 135°C; 80 to 130°C; 80 to 125°C; 80 to 120°C; 80 to 115°C; 80 to 110°C; 80 to 105°C; 80 to 100°C; 80 to 95°C; 80 to 90°C; 80 to 85°C; 85 to 200°C; 85 to 190°C; 85 to 180°C; 85 to 170°C; 85 to 160°C; 85 to 155°C; 85 to 150°C; 85 to 145°C; 85 to 140°C; 85 to 138°C; 85 to 135°C; 85 to 130°C; 85 to 125°C; 85 to 120°C; 85 to 115°C; 85 to 110°C; 85 to 105°C; 85 to 100°C; 85 to 95°C; 85 to 90°C; 90 to 200°C; 90 to 190°C; 90 to 180°C; 90 to 170°C; 90 to 160°C; 90 to 155°C; 90 to 150°C; 90 to 145°C; 90 to 140°C; 90 to 138°C; 90 to 135°C; 90 to 130°C; 90 to 125°C; 90 to 120°C; 90 to 115°C; 90 to 110°C; 90 to 105°C; 90 to 100°C; 90 to 95°C; 95 to 200°C; 95 to 190°C; 95 to 180°C; 95 to 170°C; 95 to 160°C; 95 to 155°C; 95 to 150°C; 95 to 145°C; 95 to 140°C; 95 to 138°C; 95 to 135°C; 95 to 130°C; 95 to 125°C; 95 to 120°C; 95 to 115°C; 95 to 110°C; 95 to 105°C; 95 to 100°C; 100 to 200°C; 100 to 190°C; 100 to 180°C; 100 to 170°C; 100 to 160°C; 100 to 155°C; 100 to 150°C; 100 to 145°C; 100 to 140°C; 100 to 138°C; 100 to 135°C; 100 to 130°C; 100 to 125°C; 100 to 120°C; 100 to 115°C; 100 to 110°C; 105 to 200°C; 105 to 190°C; 105 to 180°C; 105 to 170°C; 105 to 160°C; 105 to 155°C; 105 to 150°C; 105 to 145°C; 105 to 140°C; 105 to 138°C; 105 to 135°C; 105 to 130°C; 105 to 125°C; 105 to 120°C; 105 to 115°C; 105 to 110°C; 110 to 200°C; 110 to 190°C; 110 to 180°C; 110 to 170°C; 110 to 160°C; 110 to 155°C; 110 to 150°C;
110 to 145°C; 110 to 140°C; 110 to 138°C; 110 to 135°C; 110 to 130°C; 110 to 125°C; and 110 to 120°C.

[0079] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 10 to 90 mole % ethylene glycol and 10 to 90 mole % cyclohexanediol; 10 to 85 mole % ethylene glycol and 15 to 90 mole % cyclohexanediol; 10 to 80 mole % ethylene glycol and 20 to 90 mole % cyclohexanediol; 10 to 75 mole % ethylene glycol and 25 to 90 mole % cyclohexanediol; 10 to 70 mole % ethylene glycol and 30 to 90 mole % cyclohexanediol; 10 to 65 mole % ethylene glycol and 35 to 90 mole % cyclohexanediol; 10 to 60 mole % ethylene glycol and 40 to 90 mole % cyclohexanediol; 10 to 55 mole % ethylene glycol and 45 to 90 mole % cyclohexanediol; and 10 to 50 mole % ethylene glycol and 50 to 90 mole % cyclohexanediol.

[0080] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 15 to 90 mole % ethylene glycol and 10 to 85 mole % cyclohexanediol; 15 to 85 mole % ethylene glycol and 15 to 85 mole % cyclohexanediol; 15 to 80 mole % ethylene glycol and 20 to 85 mole % cyclohexanediol; 15 to 75 mole % ethylene glycol and 25 to 85 mole % cyclohexanediol; 15 to 70 mole % ethylene glycol and 30 to 85 mole % cyclohexanediol; 15 to 65 mole % ethylene glycol and 35 to 85 mole % cyclohexanediol; 15 to 60 mole % ethylene glycol and 40 to 85 mole % cyclohexanediol; 15 to 55 mole % ethylene glycol and 45 to 85 mole % cyclohexanediol; and 15 to 50 mole % ethylene glycol and 50 to 85 mole % cyclohexanediol.

[0081] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 20 to 90 mole % ethylene glycol and 10 to 80 mole % cyclohexanediol; 20 to 85 mole % ethylene glycol and 15 to 80 mole % cyclohexanediol; 20 to 80 mole % ethylene glycol and 20 to 80
mole % cyclohexanediol; 20 to 75 mole % ethylene glycol and 25 to 80
mole % cyclohexanediol; 20 to 70 mole % ethylene glycol and 30 to 80
mole % cyclohexanediol; 20 to 65 mole % ethylene glycol and 35 to 80
mole % cyclohexanediol; 20 to 60 mole % ethylene glycol and 40 to 80
mole % cyclohexanediol; 20 to 55 mole % ethylene glycol and 45 to 80
mole % cyclohexanediol; and 20 to 50 mole % ethylene glycol and 50 to 80 mole % cyclohexanediol.

[0082] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 25 to 90 mole % ethylene glycol and 10 to 75 mole % cyclohexanediol; 25 to 85 mole % ethylene glycol and 15 to 75 mole % cyclohexanediol; 25 to 80 mole % ethylene glycol and 20 to 75 mole % cyclohexanediol; 25 to 75 mole % ethylene glycol and 25 to 75 mole % cyclohexanediol; 25 to 70 mole % ethylene glycol and 30 to 75 mole % cyclohexanediol; 25 to 65 mole % ethylene glycol and 35 to 75 mole % cyclohexanediol; 25 to 60 mole % ethylene glycol and 40 to 75 mole % cyclohexanediol; 25 to 55 mole % ethylene glycol and 45 to 74 mole % cyclohexanediol; and 25 to 50 mole % ethylene glycol and 50 to 75 mole % cyclohexanediol.

[0083] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 30 to 90 mole % ethylene glycol and 10 to 70 mole % cyclohexanediol; 30 to 85 mole % ethylene glycol and 15 to 70 mole % cyclohexanediol; 30 to 80 mole % ethylene glycol and 20 to 70 mole % cyclohexanediol; 30 to 75 mole % ethylene glycol and 25 to 70 mole % cyclohexanediol; 30 to 70 mole % ethylene glycol and 30 to 70 mole % cyclohexanediol; 30 to 65 mole % ethylene glycol and 35 to 70 mole % cyclohexanediol; 30 to 60 mole % ethylene glycol and 40 to 70 mole % cyclohexanediol; 30 to 55 mole % ethylene glycol and 45 to 70 mole % cyclohexanediol; and 30 to 50 mole % ethylene glycol and 50 to 70 mole % cyclohexanediol.
In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 35 to 90 mole % ethylene glycol and 10 to 65 mole % cyclohexanediethanol; 35 to 85 mole % ethylene glycol and 15 to 65 mole % cyclohexanediethanol; 35 to 80 mole % ethylene glycol and 20 to 65 mole % cyclohexanediethanol; 35 to 75 mole % ethylene glycol and 25 to 65 mole % cyclohexanediethanol; 35 to 70 mole % ethylene glycol and 30 to 65 mole % cyclohexanediethanol; 35 to 65 mole % ethylene glycol and 35 to 65 mole % cyclohexanediethanol; 35 to 60 mole % ethylene glycol and 40 to 65 mole % cyclohexanediethanol; 35 to 55 mole % ethylene glycol and 45 to 65 mole % cyclohexanediethanol; and 35 to 50 mole % ethylene glycol and 50 to 65 mole % cyclohexanediethanol.

In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 40 to 90 mole % ethylene glycol and 10 to 60 mole % cyclohexanediethanol; 40 to 85 mole % ethylene glycol and 15 to 60 mole % cyclohexanediethanol; 40 to 80 mole % ethylene glycol and 20 to 60 mole % cyclohexanediethanol; 40 to 75 mole % ethylene glycol and 25 to 60 mole % cyclohexanediethanol; 40 to 70 mole % ethylene glycol and 30 to 60 mole % cyclohexanediethanol; 40 to 65 mole % ethylene glycol and 35 to 65 mole % cyclohexanediethanol; 40 to 60 mole % ethylene glycol and 40 to 60 mole % cyclohexanediethanol; 40 to 55 mole % ethylene glycol and 45 to 60 mole % cyclohexanediethanol; and 40 to 50 mole % ethylene glycol and 50 to 60 mole % cyclohexanediethanol.

In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 45 to 90 mole % ethylene glycol and 10 to 55 mole % cyclohexanediethanol; 45 to 85 mole % ethylene glycol and 15 to 55 mole % cyclohexanediethanol; 45 to 80 mole % ethylene glycol and 20 to 55 mole % cyclohexanediethanol; 45 to 75 mole % ethylene glycol and 25 to 55 mole % cyclohexanediethanol; 45 to 70 mole % ethylene glycol and 30 to 55 mole % cyclohexanediethanol; and 45 to 65 mole % ethylene glycol and 35 to 65 mole % cyclohexanediethanol.
mole % cyclohexanediol; 45 to 65 mole % ethylene glycol and 35 to 55 mole % cyclohexanediol; 45 to 60 mole % ethylene glycol and 40 to 55 mole % cyclohexanediol; and 45 to 55 mole % ethylene glycol and 45 to 55 mole % cyclohexanediol.

[0087] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 50 to 90 mole % ethylene glycol and 10 to 50 mole % cyclohexanediol; 50 to 85 mole % ethylene glycol and 15 to 50 mole % cyclohexanediol; 50 to 80 mole % ethylene glycol and 20 to 50 mole % cyclohexanediol; 50 to 75 mole % ethylene glycol and 25 to 50 mole % cyclohexanediol; 50 to 70 mole % ethylene glycol and 30 to 50 mole % cyclohexanediol; 50 to 65 mole % ethylene glycol and 35 to 50 mole % cyclohexanediol; and 50 to 60 mole % ethylene glycol and 40 to 50 mole % cyclohexanediol.

[0088] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: greater than 50 to 99 mole % ethylene glycol and 1 to less than 50 mole % cyclohexanediol; greater than 50 to 95 mole % ethylene glycol and 5 to less than 50 mole % cyclohexanediol; greater than 50 to 90 mole % ethylene glycol and 10 to less than 50 mole % cyclohexanediol; greater than 50 to 85 mole % ethylene glycol and 15 to less than 50 mole % cyclohexanediol; greater than 50 to 80 mole % ethylene glycol and 20 to less than 50 mole % cyclohexanediol; greater than 50 to 75 mole % ethylene glycol and 25 to less than 50 mole % cyclohexanediol; greater than 50 to 70 mole % ethylene glycol and 30 to less than 50 mole % cyclohexanediol; greater than 50 to 65 mole % ethylene glycol and 35 to less than 50 mole % cyclohexanediol; greater than 50 to 60 mole % ethylene glycol and 40 to less than 50 mole % cyclohexanediol.

[0089] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the
following combinations of ranges: greater than 51 to 99 mole % ethylene glycol and 1 to less than 49 mole % cyclohexanediethanol; greater than 51 to 95 mole % ethylene glycol and 5 to less than 49 mole % cyclohexanediethanol; greater than 51 to 90 mole % ethylene glycol and 10 to less than 49 mole % cyclohexanediethanol; greater than 51 to 85 mole % ethylene glycol and 15 to less than 49 mole % cyclohexanediethanol; greater than 51 to 80 mole % ethylene glycol and 20 to less than 49 mole % cyclohexanediethanol; greater than 51 to 75 mole % ethylene glycol and 25 to less than 49 mole % cyclohexanediethanol; greater than 51 to 70 mole % ethylene glycol and 30 to less than 49 mole % cyclohexanediethanol; greater than 51 to 65 mole % ethylene glycol and 35 to less than 49 mole % cyclohexanediethanol; greater than 51 to 60 mole % ethylene glycol and 40 to less than 49 mole % cyclohexanediethanol.

[0090] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 55 to 99 mole % ethylene glycol and 1 to 45 mole % cyclohexanediethanol; 55 to 95 mole % ethylene glycol and 5 to 45 mole % cyclohexanediethanol; 55 to 90 mole % ethylene glycol and 10 to 45 mole % cyclohexanediethanol; 55 to 85 mole % ethylene glycol and 15 to 45 mole % cyclohexanediethanol; 55 to 80 mole % ethylene glycol and 20 to 45 mole % cyclohexanediethanol; 55 to 75 mole % ethylene glycol and 25 to 45 mole % cyclohexanediethanol; 55 to 70 mole % ethylene glycol and 30 to 45 mole % cyclohexanediethanol; 55 to 65 mole % ethylene glycol and 35 to 45 mole % cyclohexanediethanol; and 55 to 60 mole % ethylene glycol and 40 to 45 mole % cyclohexanediethanol.

[0091] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 60 to 99 mole % ethylene glycol and 1 to 40 mole % cyclohexanediethanol; 60 to 95 mole % ethylene glycol and 5 to 40 mole % cyclohexanediethanol; 60 to 90 mole % ethylene glycol and 10 to 40 mole % cyclohexanediethanol; 60 to 85 mole % ethylene glycol and 15 to 40
mole % cyclohexanediol; 60 to 80 mole % ethylene glycol and 20 to 40 mole % cyclohexanediol; 60 to 75 mole % ethylene glycol and 25 to 40 mole % cyclohexanediol; and 60 to 70 mole % ethylene glycol and 30 to 40 mole % cyclohexanediol.

[0092] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 65 to 99 mole % ethylene glycol and 1 to 35 mole % cyclohexanediol; 65 to 95 mole % ethylene glycol and 5 to 35 mole % cyclohexanediol; 65 to 90 mole % ethylene glycol and 10 to 35 mole % cyclohexanediol; 65 to 85 mole % ethylene glycol and 15 to 35 mole % cyclohexanediol; 65 to 80 mole % ethylene glycol and 20 to 35 mole % cyclohexanediol; 65 to 75 mole % ethylene glycol and 25 to 35 mole % cyclohexanediol; and 65 to 70 mole % ethylene glycol and 30 to 35 mole % cyclohexanediol.

[0093] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 70 to 99 mole % ethylene glycol and 1 to 30 mole % cyclohexanediol; 70 to 95 mole % ethylene glycol and 5 to 30 mole % cyclohexanediol; 70 to 90 mole % ethylene glycol and 10 to 30 mole % cyclohexanediol; 70 to 85 mole % ethylene glycol and 15 to 30 mole % cyclohexanediol; 70 to 80 mole % ethylene glycol and 20 to 30 mole % cyclohexanediol; 70 to 75 mole % ethylene glycol and 25 to 30 mole % cyclohexanediol.

[0094] In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 75 to 99 mole % ethylene glycol and 1 to 25 mole % cyclohexanediol; 75 to 95 mole % ethylene glycol and 5 to 25 mole % cyclohexanediol; 75 to 90 mole % ethylene glycol and 10 to 25 mole % cyclohexanediol; and 75 to 85 mole % ethylene glycol and 15 to 25 mole % cyclohexanediol.
In other aspects of the invention, the glycol component for the polyesters useful in the invention include but are not limited to at least one of the following combinations of ranges: 80 to 99 mole % ethylene glycol and 1 to 20 mole % cyclohexanediol; 80 to 95 mole % ethylene glycol and 5 to 20 mole % cyclohexanediol; 80 to 90 mole % ethylene glycol and 10 to 20 mole % cyclohexanediol.

For embodiments of the invention, the polyesters useful in the invention may exhibit at least one of the following inherent viscosities as determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25 g/50 ml at 25°C: 0.10 to 1.2 dL/g; 0.35 to 1.2 dL/g; 0.50 to 1.2 dL/g; 0.50 to 1.1 dL/g; 0.50 to 1.0 dL/g; 0.50 to less than 1 dL/g; 0.50 to 0.98 dL/g; 0.50 to 0.95 dL/g; 0.50 to 0.90 dL/g; 0.50 to 0.85 dL/g; 0.50 to 0.80 dL/g; 0.50 to 0.75 dL/g; 0.50 to less than 0.75 dL/g; 0.50 to 0.72 dL/g; 0.50 to 0.70 dL/g; 0.50 to less than 0.70 dL/g; 0.50 to 0.68 dL/g; 0.50 to less than 0.68 dL/g; 0.50 to 0.65 dL/g; 0.55 to 1.2 dL/g; 0.55 to 1.1 dL/g; 0.55 to less than 1 dL/g; 0.55 to 0.98 dL/g; 0.55 to 0.95 dL/g; 0.55 to 0.90 dL/g; 0.55 to 0.85 dL/g; 0.55 to 0.80 dL/g; 0.55 to 0.75 dL/g; 0.55 to less than 0.75 dL/g; 0.55 to 0.72 dL/g; 0.55 to 0.70 dL/g; 0.55 to less than 0.70 dL/g; 0.55 to 0.68 dL/g; 0.55 to less than 0.68 dL/g; 0.55 to 0.65 dL/g; 0.60 to 1.2 dL/g; 0.60 to 1.1 dL/g; 0.60 to 1.0 dL/g; 0.60 to less than 1 dL/g; 0.60 to 0.98 dL/g; 0.60 to 0.95 dL/g; 0.60 to 0.90 dL/g; 0.60 to 0.85 dL/g; 0.60 to 0.80 dL/g; 0.60 to 0.75 dL/g; 0.60 to less than 0.75 dL/g; 0.60 to 0.72 dL/g; 0.60 to 0.70 dL/g; 0.60 to less than 0.70 dL/g; 0.60 to 0.68 dL/g; 0.60 to less than 0.68 dL/g; 0.60 to 0.65 dL/g; 0.65 to 1.2 dL/g; 0.65 to 1.1 dL/g; 0.65 to 1.0 dL/g; 0.65 to less than 1 dL/g; 0.65 to 0.98 dL/g; 0.65 to 0.95 dL/g; 0.65 to 0.90 dL/g; 0.65 to 0.85 dL/g; 0.65 to 0.80 dL/g; 0.65 to 0.75 dL/g; 0.65 to less than 0.75 dL/g; 0.65 to less than 0.72 dL/g;

It is contemplated that compositions useful in the invention can possess at least one of the inherent viscosity ranges described herein and at least one of the monomer ranges for the compositions described herein unless otherwise stated. It is also contemplated that compositions useful in the invention can possess at least one of the Tg ranges described herein and at least one of
the monomer ranges for the compositions described herein unless otherwise stated. It is also contemplated that compositions useful in the invention can possess at least one of the inherent viscosity ranges described herein, at least one of the Tg ranges described herein, and at least one of the monomer ranges for the compositions described herein unless otherwise stated.

[0098] In one embodiment, terephthalic acid may be used as the starting material. In another embodiment, dimethyl terephthalate may be used as the starting material. In yet another embodiment, mixtures of terephthalic acid and dimethyl terephthalate may be used as the starting material and/or as an intermediate material.

[0099] In certain embodiments, terephthalic acid or an ester thereof, such as, for example, dimethyl terephthalate or a mixture of terephthalic acid residues and an ester thereof can make up a portion or all of the dicarboxylic acid component used to form the polyesters useful in the invention. In certain embodiments, terephthalic acid residues can make up a portion or all of the dicarboxylic acid component used to form the polyesters useful in the invention. In certain embodiments, higher amounts of terephthalic acid can be used in order to produce a higher impact strength polyester. For purposes of this disclosure, the terms "terephthalic acid" and "dimethyl terephthalate" are used interchangeably herein. In one embodiment, dimethyl terephthalate is part or all of the dicarboxylic acid component used to make the polyesters useful in the present invention. In all embodiments, ranges of from 70 to 100 mole %; or 80 to 100 mole %; or 90 to 100 mole %; or 99 to 100 mole %; or 100 mole % terephthalic acid and/or dimethyl terephthalate and/or mixtures thereof may be used.

[00100] In addition to terephthalic acid, the dicarboxylic acid component of the polyester useful in the invention can comprise up to 30 mole %, up to 20 mole %, up to 10 mole %, up to 5 mole%, or up to 1 mole % of one or more modifying aromatic dicarboxylic acids. Yet another embodiment contains 0 mole % modifying aromatic dicarboxylic acids. Thus, if present, it is contemplated that the amount of one or more modifying aromatic dicarboxylic acids can range from any of these preceding endpoint values including, for example, from 0.01 to 30
mole %, 0.01 to 20 mole %, from 0.01 to 10 mole %, from 0.01 to 5 mole % and from 0.01 to 1 mole %. In one embodiment, modifying aromatic dicarboxylic acids that may be used in the present invention include but are not limited to those having up to 20 carbon atoms, and which can be linear, para-oriented, or symmetrical. Examples of modifying aromatic dicarboxylic acids which may be used in this invention include, but are not limited to, isophthalic acid, 4,4'-biphenyldicarboxylic acid, 1,4-, 1,5-, 2,6-, 2,7-naphthalenedicarboxylic acid, and trans-4,4'-stilbenedicarboxylic acid, and esters thereof. In one embodiment, the modifying aromatic dicarboxylic acid is isophthalic acid.

[00101] The carboxylic acid component of the polyesters useful in the invention can be further modified with up to 10 mole %, such as up to 5 mole % or up to 1 mole % of one or more aliphatic dicarboxylic acids containing 2 to 6 carbon atoms, such as, for example, cyclohexanedicarboxylic, malonic, succinic, glutaric, adipic, pimelic, suberic, azelaic and dodecanedioic dicarboxylic acids. Certain embodiments can also comprise 0.01 to 10 mole %, such as 0.1 to 10 mole %, 1 or 10 mole %, 5 to 10 mole % of one or more modifying aliphatic dicarboxylic acids. Yet another embodiment contains 0 mole % modifying aliphatic dicarboxylic acids. The total mole % of the dicarboxylic acid component is 100 mole %. In one embodiment, adipic acid and/or glutaric acid are provided in the modifying aliphatic dicarboxylic acid component of the invention.

[00102] The modifying dicarboxylic acids of the invention can include indan dicarboxylic acids, for example, indan-1,3-dicarboxylic acids and/or phenylindan dicarboxylic acids. In one embodiment, the dicarboxylic acid may be chosen from at least one of 1,2,3-trimethyl-3-phenylindan-4',5-dicarboxylic acid and 1,1,3-trimethyl-5-carboxy-3-(4-carboxyphenyl)indan dicarboxylic acid. For the purposes of this invention, any of the indan dicarboxylic acids described in United States Patent Application Publication No. 2006/0004151A1 entitled "Copolymers Containing Indan Moieties and Blends Thereof" by Shaikh et al., assigned to General Electric Company may be used as at least one modifying dicarboxylic acid within the scope of this invention; United States Patent Application
Publication No. 2006/00041 is incorporated herein by reference with respect to any of the indan dicarboxylic acids described therein.

**[00103]** Esters of terephthalic acid and the other modifying dicarboxylic acids or their corresponding esters and/or salts may be used instead of the dicarboxylic acids. Suitable examples of dicarboxylic acid esters include, but are not limited to, the dimethyl, diethyl, dipropyl, diisopropyl, dibutyl, and diphenyl esters. In one embodiment, the esters are chosen from at least one of the following: methyl, ethyl, propyl, isopropyl, and phenyl esters.

**[00104]** For the desired polyester, the molar ratio of cis/trans 2,2,4,4-tetramethyl-1,3-cyclobutanediol can vary from the pure form of each and mixtures thereof. In certain embodiments, the molar percentages for cis and/or trans 2,2,4,4-tetramethyl-1,3-cyclobutanediol are greater than 50 mole % cis and less than 50 mole % trans; or greater than 55 mole % cis and less than 45 mole % trans; or 30 to 70 mole % cis and 70 to 30 mole % trans; or 40 to 60 mole % cis and 60 to 40 mole % trans; or 50 to 70 mole % cis and 50 to 30 mole % cis; or 50 to 70 mole % cis and 50 to 30 mole % trans; or 60 to 70 mole % cis and 30 to 40 mole % trans; or greater than 70 mole % cis and less than 30 mole % trans; wherein the total mole percentages for cis- and trans- 2,2,4,4-tetramethyl-1,3-cyclobutanediol is equal to 100 mole %. In an additional embodiment, the molar ratio of cis/trans 2,2,4,4-tetramethyl-1,3-cyclobutanediol can vary within the range of 50/50 to 0/100, for example, between 40/60 to 20/80.

**[00105]** The cyclohexanedicarboxylic acid can be cis, trans, or a mixture thereof, for example, a cis/trans ratio of 60:40 to 40:60 or a cis/trans ratio of 70:30 to 30:70. In another embodiment, the trans-cyclohexanedicarboxylic acid can be present in an amount of 60 to 80 mole % and the cis-cyclohexanedicarboxylic acid can be present in an amount of 20 to 40 mole % wherein the total percentages of cis-cyclohexanedicarboxylic acid and trans-cyclohexanedicarboxylic acid is equal to 100 mole %. In particular embodiments, the trans-cyclohexanedicarboxylic acid can be present in an amount of 60 mole % and the cis-cyclohexanedicarboxylic acid can be present in an amount of 40 mole %, or the trans-cyclohexanedicarboxylic acid can be present in an amount of 70 mole % and the cis-
cyclohexanedimethanol can be present in an amount of 30 mole %. Any of 1,1-, 1,2-, 1,3-, 1,4- isomers of cyclohexanedimethanol or mixtures thereof may be present in the glycol component of this invention. In one embodiment, the polyesters useful in the invention comprise 1,4-cyclohexanedimethanol. In another embodiment, the polyesters useful in the invention comprise 1,4-cyclohexanedimethanol and 1,3-cyclohexanedimethanol. The molar ratio of cis/trans 1,4-cyclohexandimethanol can vary within the range of 50/50 to 0/100, for example, between 40/60 to 20/80.

In one embodiment, the glycol component of the polyester portion of the polyester compositions useful in the invention can contain modifying glycols which are not ethylene glycol or cyclohexanedimethanol; in one embodiment, the glycol component of the polyester portion of the polyester compositions useful in the invention can contain less than 45 mole % of one or more modifying glycols which are not ethylene glycol or cyclohexanedimethanol; in one embodiment, the glycol component of the polyester portion of the polyester compositions useful in the invention can contain 30 mole % or less of one or more modifying glycols which are not ethylene glycol or cyclohexanedimethanol; in one embodiment, the glycol component of the polyester portion of the polyester compositions useful in the invention can contain 25 mole % or less of one or more modifying glycols which are not ethylene glycol or cyclohexanedimethanol; in one embodiment, the glycol component of the polyester portion of the polyester compositions useful in the invention can contain 20 mole % or less of one or more modifying glycols which are not ethylene glycol or cyclohexanedimethanol; in one embodiment, the polyesters useful in the invention may contain less than 15 mole % or of one or more modifying glycols. In another embodiment, the polyesters useful in the invention can contain 10 mole % or less of one or more modifying glycols. In another embodiment, the polyesters useful in the invention can contain 5 mole % or less of one or more modifying glycols. In another embodiment, the polyesters useful in the invention can contain 3 mole % or less of one or more modifying glycols. In another embodiment, the polyesters useful in the invention can contain 0 mole % modifying glycols.
In one embodiment, the glycol component of the polyester portion of the polyester compositions useful in the invention can contain modifying glycols which is 2,2,4,4-tetramethyl-1,3-cyclobutanediol; in one embodiment, the glycol component of the polyester portion of the polyester compositions useful in the invention can contain less than 45 mole % of 2,2,4,4-tetramethyl-1,3-cyclobutanediol residues; in one embodiment, the glycol component of the polyester portion of the polyester compositions useful in the invention can contain 30 mole % or less of 2,2,4,4-tetramethyl-1,3-cyclobutanediol residues; in one embodiment, the glycol component of the polyester portion of the polyester compositions useful in the invention can contain 25 mole % or less of 2,2,4,4-tetramethyl-1,3-cyclobutanediol residues; in one embodiment, the glycol component of the polyester portion of the polyester compositions useful in the invention can contain 20 mole % or less of 2,2,4,4-tetramethyl-1,3-cyclobutanediol residues; in one embodiment, the polyesters useful in the invention may contain less than 15 mole % of 2,2,4,4-tetramethyl-1,3-cyclobutanediol residues. In another embodiment, the polyesters useful in the invention can contain 10 mole % or less of 2,2,4,4-tetramethyl-1,3-cyclobutanediol residues. In another embodiment, the polyesters useful in the invention can contain 5 mole % or less of 2,2,4,4-tetramethyl-1,3-cyclobutanediol residues. In another embodiment, the polyesters useful in the invention can contain 3 mole % or less of 2,2,4,4-tetramethyl-1,3-cyclobutanediol residues. In another embodiment, the polyesters useful in the invention can contain 0 mole % of 2,2,4,4-tetramethyl-1,3-cyclobutanediol residues.

Certain embodiments of the polyesters in the invention can also contain 0.01 to 45 mole %, 0.01 to 40 mole %, 0.01 to 35 mole %, 0.01 to 30 mole %, 0.01 to 25 mole %, 0.01 to 20 mole %, 0.01 to 15 mole %, 0.01 to 10 mole %, 0.01 to 5 mole %, of one or more modifying glycols. Any of these embodiments can contain 2,2,4,4-tetramethyl-1,3-cyclobutanediol as the modifying glycol.

Certain embodiments of the polyesters in the invention can also contain 1 to 45 mole %, 1 to 40 mole %, 1 to 35 mole %, 1 to 30 mole %, 1 to
25 mole %, 1 to 20 mole %, 1 to 15 mole %, 1 to 10 mole %, 1 to 5 mole %, of one or more modifying glycols. Any of these embodiments can contain 2,2,4,4-tetramethyl-1,3-cyclobutanediol as the modifying glycol.

[00110] Certain embodiments of the polyesters in the invention can also contain 5 to 45 mole %, 5 to 40 mole %, 5 to 35 mole %, 5 to 30 mole %, 5 to 25 mole %, 5 to 20 mole %, 5 to 15 mole %, 5 to 10 mole %, of one or more modifying glycols. Any of these embodiments can contain 2,2,4,4-tetramethyl-1,3-cyclobutanediol as the modifying glycol.

[00111] Certain embodiments of the polyesters in the invention can also contain 10 to 45 mole %, 10 to 40 mole %, 10 to 35 mole %, 10 to 30 mole %, 10 to 25 mole %, 10 to 20 mole %, of one or more modifying glycols. Any of these embodiments can contain 2,2,4,4-tetramethyl-1,3-cyclobutanediol as the modifying glycol.

[00112] Certain embodiments of the polyesters in the invention can also contain 15 to 45 mole %, 15 to 40 mole %, 15 to 35 mole %, 15 to 30 mole %, 15 to 25 mole %, of one or more modifying glycols. Any of these embodiments can contain 2,2,4,4-tetramethyl-1,3-cyclobutanediol as the modifying glycol.

[00113] Certain embodiments of the polyesters in the invention can also contain 20 to 45 mole %, 20 to 40 mole %, 20 to 35 mole %, 20 to 30 mole %, of one or more modifying glycols. Any of these embodiments can contain 2,2,4,4-tetramethyl-1,3-cyclobutanediol as the modifying glycol.

[00114] Certain embodiments of the polyesters in the invention can also contain 25 to 45 mole %, 25 to 40 mole %, 25 to 35 mole %, of one or more modifying glycols. Any of these embodiments can contain 2,2,4,4-tetramethyl-1,3-cyclobutanediol as the modifying glycol.

[00115] Certain embodiments of the polyesters in the invention can also contain 30 to 45 mole %, 30 to 40 mole %, 30 to 35 mole %, of one or more modifying glycols. Any of these embodiments can contain 2,2,4,4-tetramethyl-1,3-cyclobutanediol as the modifying glycol.

[00116] Modifying glycols useful in the polyesters useful in the invention refer to diols other than ethylene glycol and cyclohexanedimethanol and can contain 2 to
16 carbon atoms. Examples of suitable modifying glycols include, but are not limited to, 2,2,4,4-tetramethyl-1,3-cyclobutanediol residues, 1,2-propanediol, 1,3-propanediol, neopentyl glycol, 1,4-butanediol, 1,5-pentanediol, 1,6-hexanediol, p-xylene glycol, polytetramethylene glycol, and mixtures thereof. In another embodiment, the modifying glycols include, but are not limited to, at least one of 1,3-propanediol and 1,4-butanediol. In another embodiment, 1,3-propanediol and 1,4-butanediol are excluded as modifying diols. Again, in any of the aforementioned ranges of modifying glycols, 2,2,4,4-tetramethyl-1,3-cyclobutanediol can be the modifying glycol.

[00117] The polyesters and/or the polycarbonates useful in the polyesters compositions of the invention can comprise from 0 to 10 mole percent, for example, from 0.01 to 5 mole percent, from 0.01 to 1 mole percent, from 0.05 to 5 mole percent, from 0.05 to 1 mole percent, or from 0.1 to 0.7 mole percent, based the total mole percentages of either the diol or diacid residues; respectively, of one or more residues of a branching monomer, also referred to herein as a branching agent, having 3 or more carboxyl substituents, hydroxyl substituents, or a combination thereof. In certain embodiments, the branching monomer or agent may be added prior to and/or during and/or after the polymerization of the polyester. The polyester(s) useful in the invention can thus be linear or branched. The polycarbonate can also be linear or branched. In certain embodiments, the branching monomer or agent may be added prior to and/or during and/or after the polymerization of the polycarbonate.

[00118] Examples of branching monomers include, but are not limited to, multifunctional acids or multifunctional alcohols such as trimellitic acid, trimellitic anhydride, pyromellitic dianhydride, trimethylolpropane, glycerol, pentaerythritol, citric acid, tartaric acid, 3-hydroxyglutaric acid and the like. In one embodiment, the branching monomer residues can comprise 0.1 to 0.7 mole percent of one or more residues chosen from at least one of the following: trimellitic anhydride, pyromellitic dianhydride, glycerol, sorbitol, 1,2,6-hexanetriol, pentaerythritol, trimethylolethylene, and/or trimesic acid. The branching monomer may be added to the polyester reaction mixture or blended with the polyester in the form of a
concentrate as described, for example, in U.S. Patent Nos. 5,654,347 and 5,696,176, whose disclosure regarding branching monomers is incorporated herein by reference.

[00119] The polyesters of the invention can comprise at least one chain extender. Suitable chain extenders include, but are not limited to, multifunctional (including, but not limited to, bifunctional) isocyanates, multifunctional epoxides, including for example, epoxylated novolacs, and phenoxy resins. In certain embodiments, chain extenders may be added at the end of the polymerization process or after the polymerization process. If added after the polymerization process, chain extenders can be incorporated by compounding or by addition during conversion processes such as injection molding or extrusion. The amount of chain extender used can vary depending on the specific monomer composition used and the physical properties desired but is generally about 0.1 percent by weight to about 10 percent by weight, such as about 0.1 to about 5 percent by weight, based on the total weight of the polyester.

[00120] The glass transition temperature (Tg) of the polyesters useful in the invention was determined using a TA DSC 2920 from Thermal Analyst Instrument at a scan rate of 20°C/min.

[00121] Polyesters useful in the present invention, can be used to produce articles of manufacture, including but not limited to, injection molded parts, injection blow molded articles, injection stretch blow molded articles, extruded film, extruded sheet, extrusion blow molded articles, extrusion stretch blow molded articles, and fibers. A thermoformable sheet is an example of an article of manufacture provided by this invention.

[00122] The polyesters of the invention can be amorphous or semicrystalline. In one aspect, certain polyesters useful in the invention can have relatively low crystallinity. Certain polyesters useful in the invention can thus have a substantially amorphous morphology, meaning that the polyesters comprise substantially unordered regions of polymer.

[00123] In one embodiment, an "amorphous" polyester can have a crystallization half-time of greater than 5 minutes at 170°C or greater than 10
minutes at 170°C or greater than 50 minutes at 170 °C or greater than 100 minutes at 170°C. In one embodiment, of the invention, the crystallization half-times can be greater than 1,000 minutes at 170°C. In another embodiment of the invention, the crystallization half-times of the polyesters useful in the invention can be greater than 10,000 minutes at 170°C. The crystallization half time of the polyester, as used herein, may be measured using methods well-known to persons of skill in the art. For example, the crystallization half time of the polyester, t 1/2, can be determined by measuring the light transmission of a sample via a laser and photo detector as a function of time on a temperature controlled hot stage. This measurement can be done by exposing the polymers to a temperature, Tmax, and then cooling it to the desired temperature. The sample can then be held at the desired temperature by a hot stage while transmission measurements are made as a function of time. Initially, the sample can be visually clear with high light transmission and becomes opaque as the sample crystallizes. The crystallization half-time is the time at which the light transmission is halfway between the initial transmission and the final transmission. Tmax is defined as the temperature required to melt the crystalline domains of the sample (if crystalline domains are present). The sample can be heated to Tmax to condition the sample prior to crystallization half time measurement. The absolute Tmax temperature is different for each composition. For example PCT can be heated to some temperature greater than 290 °C to melt the crystalline domains.

[00124] In one embodiment, certain polyesters useful in this invention can be visually clear. The term "visually clear" is defined herein as an appreciable absence of cloudiness, haziness, and/or muddiness, when inspected visually. In another embodiment, when the polyesters are blended with polycarbonate, including but not limited to, bisphenol A polycarbonates, the blends can be visually clear.

[00125] In other embodiments of the invention, the polyesters useful in the invention may have a yellowness index (ASTM D-1 925) of less than 50 or less than 20.
In one embodiment, the polyesters useful in the invention and/or the polyester compositions of the invention and/or the polyester blends, with or without toners, can have color values $L^*$, $a^*$ and $b^*$ which can be determined using a Hunter Lab Ultrascan Spectra Colorimeter manufactured by Hunter Associates Lab Inc., Reston, Va. The color determinations are averages of values measured on either pellets of the polyesters or plaques or other items injection molded or extruded from them. They are determined by the $L^*$ $a^*$ $b^*$ color system of the CIE (International Commission on Illumination) (translated), wherein $L^*$ represents the lightness coordinate, $a^*$ represents the red/green coordinate, and $b^*$ represents the yellow/blue coordinate. In certain embodiments, the $b^*$ values for the polyesters useful in the invention can be from -10 to less than 10 and the $L^*$ values can be from 50 to 90. In other embodiments, the $b^*$ values for the polyesters or polyester compositions or polymer blends useful in the invention can be present in one of the following ranges: from -10 to 9; -10 to 8; -10 to 7; -10 to 6; -10 to 5; -10 to 4; -10 to 3; -10 to 2; from -5 to 9; -5 to 8; -5 to 7; -5 to 6; -5 to 5; -5 to 4; -5 to 3; -5 to 2; 0 to 9; 0 to 8; 0 to 7; 0 to 6; 0 to 5; 0 to 4; 0 to 3; 0 to 2; 1 to 10; 1 to 9; 1 to 8; 1 to 7; 1 to 6; 1 to 5; 1 to 4; 1 to 3; and 1 to 2. In other embodiments, the $L^*$ value for the polyesters or polyester compositions or polymer blends useful in the invention can be present in one of the following ranges: 50 to 60; 50 to 70; 50 to 80; 50 to 90; 60 to 70; 60 to 80; 60 to 90; 70 to 80; 79 to 90.

Amounts of chelating phosphorus species added during polymerization or post manufacturing can include but are not limited to: 1 to 5000 ppm; 1 to 1000 ppm, 1 to 900 ppm, 1 to 800 ppm, 1 to 700 ppm. 1 to 600 ppm, 1 to 500 ppm, 1 to 400 ppm, 1 to 350 ppm, 1 to 300 ppm, 1 to 250 ppm, 1 to 200 ppm, 1 to 150 ppm, 1 to 100 ppm; 1 to 5000 ppm; 1 to 1000 ppm, 1 to 900 ppm, 1 to 800 ppm, 1 to 700 ppm. 1 to 600 ppm, 1 to 500 ppm, 1 to 400 ppm, 1 to 350 ppm, 1 to 300 ppm, 1 to 250 ppm, 1 to 200 ppm, 1 to 150 ppm, 1 to 100 ppm; 1 to 5000 ppm; 1 to 1000 ppm, 1 to 900 ppm, 1 to 800 ppm, 1 to 700 ppm. 1 to 600 ppm, 1 to 500 ppm, 1 to 400 ppm, 1 to 350 ppm, 1 to 300 ppm, 1 to 250 ppm, 1 to 200 ppm, 1 to 150 ppm, 1 to 100 ppm; based on the total weight of the polyester composition.

In one embodiment, amounts of chelating phosphorus species of the invention added during polymerization are chosen from the following: 1 to 5000 ppm; 1 to 1000 ppm, 1 to 900 ppm, 1 to 800 ppm, 1 to 700 ppm. 1 to 600 ppm, 1 to 500 ppm, 1 to 400 ppm, 1 to 350 ppm, 1 to 300 ppm, 1 to 250 ppm, 1 to 200 ppm, 1 to 150 ppm, 1 to 100 ppm; 1 to 5000 ppm; 1 to 1000 ppm, 1 to 900 ppm, 1 to 800 ppm, 1 to 700 ppm. 1 to 600 ppm, 1 to 500 ppm, 1 to 400 ppm, 1 to 350 ppm, 1 to 300 ppm, 1 to 250 ppm, 1 to 200 ppm, 1 to 150 ppm, 1 to 100 ppm; based on the total weight of the polyester composition.
ppm; 1 to 100 ppm, 1 to 900 ppm, 1 to 800 ppm, 1 to 700 ppm, 1 to 600 ppm, 1 to 500 ppm, 1 to 400 ppm, 1 to 350 ppm, 1 to 300 ppm, 1 to 250 ppm, 1 to 200 ppm, 1 to 150 ppm, 1 to 100 ppm; 1 to 60 ppm; 2 to 5000 ppm; 2 to 1000 ppm, 2 to 900 ppm, 2 to 800 ppm, 2 to 700 ppm; 2 to 600 ppm, 2 to 500 ppm, 2 to 400 ppm, 2 to 350 ppm, 2 to 300 ppm, 2 to 250 ppm, 2 to 200 ppm, 2 to 150 ppm, 2 to 100 ppm; 2 to 60 ppm; 2 to 20 ppm, 3 to 5000 ppm; 3 to 1000 ppm, 3 to 900 ppm, 3 to 800 ppm, 3 to 700 ppm, 3 to 600 ppm, 3 to 500 ppm, 3 to 400 ppm, 3 to 350 ppm, 3 to 300 ppm, 3 to 250 ppm, 3 to 200 ppm, 3 to 150 ppm, 3 to 100 ppm; 3 to 60 ppm; 3 to 20 ppm, 4 to 5000 ppm; 4 to 1000 ppm, 4 to 900 ppm, 4 to 800 ppm, 4 to 700 ppm, 4 to 600 ppm, 4 to 500 ppm, 4 to 400 ppm, 4 to 350 ppm, 4 to 300 ppm, 4 to 250 ppm, 4 to 200 ppm, 4 to 150 ppm, 4 to 100 ppm, 4 to 60 ppm; 4 to 20 ppm, 5 to 5000 ppm; 5 to 1000 ppm, 5 to 900 ppm, 5 to 800 ppm, 5 to 700 ppm, 5 to 600 ppm, 5 to 500 ppm, 5 to 400 ppm, 5 to 350 ppm, 5 to 300 ppm, 5 to 250 ppm, 5 to 200 ppm, 5 to 150 ppm, 5 to 100 ppm; 5 to 60 ppm; 5 to 20 ppm, 6 to 5000 ppm; 6 to 1000 ppm, 6 to 900 ppm, 6 to 800 ppm, 6 to 700 ppm, 6 to 600 ppm, 6 to 500 ppm, 6 to 400 ppm, 6 to 350 ppm, 6 to 300 ppm, 6 to 250 ppm, 6 to 200 ppm, 6 to 150 ppm, 6 to 100 ppm; 6 to 60 ppm; 6 to 20 ppm, 7 to 5000 ppm; 7 to 1000 ppm, 7 to 900 ppm, 7 to 800 ppm, 7 to 700 ppm, 7 to 600 ppm, 7 to 500 ppm, 7 to 400 ppm, 7 to 350 ppm, 7 to 300 ppm, 7 to 250 ppm, 7 to 200 ppm, 7 to 150 ppm, 7 to 100 ppm; 7 to 60 ppm; 7 to 20 ppm, 8 to 5000 ppm; 8 to 1000 ppm, 8 to 900 ppm, 8 to 800 ppm, 8 to 700 ppm, 8 to 600 ppm, 8 to 500 ppm, 8 to 400 ppm, 8 to 350 ppm, 8 to 300 ppm, 8 to 250 ppm, 8 to 200 ppm, 8 to 150 ppm, 8 to 100 ppm; 8 to 60 ppm; 8 to 20 ppm, 9 to 5000 ppm; 9 to 1000 ppm, 9 to 900 ppm, 9 to 800 ppm, 9 to 700 ppm, 9 to 600 ppm, 9 to 500 ppm, 9 to 400 ppm, 9 to 350 ppm, 9 to 300 ppm, 9 to 250 ppm, 9 to 200 ppm, 9 to 150 ppm, 9 to 100 ppm; 9 to 60 ppm; 9 to 20 ppm, 10 to 5000 ppm; 10 to 1000 ppm, 10 to 900 ppm, 10 to 800 ppm, 10 to 700 ppm, 10 to 600 ppm, 10 to 500 ppm, 10 to 400 ppm, 10 to 350 ppm, 10 to 300 ppm, 10 to 250 ppm, 10 to 200 ppm, 10 to 150 ppm, 10 to 100 ppm, 10 to 60 ppm, 10 to 20 ppm, 50 to 5000 ppm, 50 to 1000 ppm, 50 to 900 ppm, 50 to 800 ppm, 50 to 700 ppm, 50 to 600 ppm, 50 to 500 ppm, 50 to 400 ppm, 50 to 350 ppm, 50 to 300 ppm, 50
to 250 ppm, 50 to 200 ppm, 50 to 150 ppm, 50 to 100 ppm; 50 to 80 ppm, 10 to 5000 ppm, 100 to 1000 ppm, 100 to 900 ppm, 100 to 800 ppm, 100 to 700 ppm, 100 to 600 ppm, 100 to 500 ppm, 100 to 400 ppm, 100 to 350 ppm, 100 to 300 ppm, 100 to 250 ppm, 100 to 200 ppm, 100 to 150 ppm; 150 to 5000 ppm, 150 to 1000 ppm, 150 to 900 ppm, 150 to 800 ppm, 150 to 700 ppm, 150 to 600 ppm, 150 to 500 ppm, 150 to 400 ppm, 150 to 350 ppm, 150 to 300 ppm, 150 to 250 ppm, 150 to 200 ppm, 200 to 5000 ppm, 200 to 1000 ppm, 200 to 900 ppm, 200 to 800 ppm, 200 to 700 ppm, 200 to 600 ppm, 200 to 500 ppm, 200 to 400 ppm, 200 to 350 ppm, 200 to 300 ppm, 200 to 250 ppm, 250 to 5000 ppm, 250 to 1000 ppm, 250 to 900 ppm, 250 to 800 ppm, 250 to 700 ppm, 250 to 600 ppm, 250 to 500 ppm, 250 to 400 ppm, 250 to 350 ppm, 250 to 300 ppm, 500 to 5000 ppm, 300 to 1000 ppm, 300 to 900 ppm, 300 to 800 ppm, 300 to 700 ppm, 300 to 600 ppm, 300 to 500 ppm, 300 to 400 ppm, 300 to 350 ppm, 350 to 5000 ppm, 350 to 1000 ppm, 350 to 900 ppm, 350 to 800 ppm, 350 to 700 ppm, 350 to 600 ppm, 350 to 500 ppm, 350 to 400 ppm; based on the total weight of the polyester and as measured in the form of phosphorus atoms in the final polyester.

[00129] The invention further relates to a polymer blend which can comprise any amount of the polyesters useful in the invention blended with any other polymer. In one embodiment, the blend comprises:

(a) from 0 to 95 weight % of at least one of the polyesters described above (Polymer A); and

(b) from 5 to 100 weight % of at least one of polymeric components (Polymer B).

[00130] In one embodiment, the blend comprises:

(a) from 0.01 to 95 weight % of at least one of the polyesters described above (Polymer A); and

(b) from 0.01 to 95 weight % of at least one of polymeric components (Polymer B).

[00131] In one embodiment, the blend comprises:

(a) from 5 to 95 weight % of at least one of the polyesters (Polymer A) described above; and
(b) from 5 to 95 weight % of at least one of polymeric components (Polymer B).

[00132] The polymer blend can include components other than Polymers A and B. In addition, when Polymer B is a polycarbonate, the total weight % of Polymers A and B is 100 weight percent of Polymers A and B. If other components besides Polymers A and B (where polymer B is polycarbonate) are added to the polymer blend, the total weight of all components will equal 100 weight percent of the total polymer blend. In one embodiment, if an article of manufacture contains the polymer blend, it is contemplated that some articles of manufacture may have portions that contain the polymer blend and portions that do not contain the polymer blend. In another embodiment, it is also contemplated that an article of manufacture can be manufactured from only the polymer blend.

[00133] In certain embodiments, the polymer blends of the invention can comprise: 5 to 90 weight % of Polymer A and 10 to 95 weight of Polymer B; 5 to 85 weight % of Polymer A and 15 to 90 weight% of Polymer B; 10 to 80 weight% of Polymer A and 20 to 95 weight% of Polymer B; 5 to 75 weight % of Polymer A and 25 to 95 weight % of Polymer B; 5 to 70 weight % of Polymer A and 30 to 95 weight % of Polymer B; 5 to 65 weight % of Polymer A and 35 to 95 weight % of Polymer B; 5 to 60 weight % of Polymer A and 40 to 95 weight % of Polymer B; 5 to 55 weight % of Polymer A and 45 to 95 weight % of Polymer B; and 5 to 50 weight % of Polymer A and 50 to 95 weight % of Polymer B.

[00134] In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 10 to 90 weight % of Polymer A and 10 to 90 weight of Polymer B; 10 to 85 weight % of Polymer A and 15 to 90 weight% of Polymer B; 10 to 80 weight% of Polymer A and 20 to 90 weight% of Polymer B; 10 to 75 weight % of Polymer A and 25 to 90 weight % of Polymer B; 10 to 70 weight % of Polymer A and 30 to 90 weight % of Polymer B; 10 to 65 weight % of Polymer A and 35 to 90 weight % of Polymer B; 10 to 60 weight % of Polymer A and 40 to 90 weight % of Polymer B; 10 to 55 weight % of Polymer A and 45 to 90 weight % of Polymer B; and 10 to 50 weight % of Polymer A and 50 to 90 weight % of Polymer B.
In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges:
15 to 90 weight % of Polymer A and 10 to 85 weight % of Polymer B; 15 to 85 weight % of Polymer A and 15 to 85 weight % of Polymer B; 15 to 80 weight % of Polymer A or and 20 to 85 weight % of Polymer B; 15 to 75 weight % of Polymer A and 25 to 85 weight % of Polymer B; 15 to 70 weight % of Polymer A and 30 to 85 weight % of Polymer B; 15 to 65 weight % of Polymer A and 35 to 85 weight % of Polymer B; 15 to 60 weight % of Polymer A and 40 to 85 weight % of Polymer B; 15 to 55 weight % of Polymer A and 45 to 85 weight % of Polymer B; and 15 to 50 weight % of Polymer A and 50 to 85 weight % of Polymer B.

In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges:
20 to 90 weight % of Polymer A and 10 to 80 weight % of Polymer B; 20 to 85 weight % of Polymer A and 15 to 80 weight % of Polymer B; 20 to 80 weight % of Polymer A and 20 to 80 weight % of Polymer B; 20 to 75 weight % of Polymer A and 25 to 80 weight % of Polymer B; 20 to 70 weight % of Polymer A and 30 to 80 weight % of Polymer B; 20 to 65 weight % of Polymer A and 35 to 80 weight % of Polymer B; 20 to 60 mole % of Polymer A and 40 to 80 mole % of Polymer B; 20 to 55 mole % of Polymer A and 45 to 80 mole % of Polymer B; and 20 to 50 mole of Polymer A and 50 to 80 mole % of Polymer B.

In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges:
25 to 90 weight % of Polymer A and 10 to 75 weight % of Polymer B; 25 to 85 weight % of Polymer A and 15 to 75 weight % of Polymer B; 25 to 80 weight % of Polymer A and 20 to 75 weight % of Polymer B; 25 to 75 weight % of Polymer A and 25 to 75 weight % of Polymer B; 25 to 70 weight % of Polymer A and 30 to 75 weight % of Polymer B; 25 to 65 weight % of Polymer A and 35 to 75 weight % of Polymer B; 25 to 60 weight % of Polymer A and 40 to 75 weight % of Polymer B; 25 to 55 weight % of Polymer A and 45 to 74 weight % of Polymer B; and 25 to 50 weight % of Polymer A and 50 to 75 weight % of Polymer B.
In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 30 to 90 weight % of Polymer A and 10 to 70 weight % of Polymer B; 30 to 85 weight % of Polymer A and 15 to 70 weight % of Polymer B; 30 to 80 weight % of Polymer A and 20 to 70 weight % of Polymer B; 30 to 75 weight % of Polymer A and 25 to 70 weight % of Polymer B; 30 to 70 weight % of Polymer A and 30 to 70 weight % of Polymer B; 30 to 65 weight % of Polymer A and 35 to 70 weight % of Polymer B; 30 to 60 weight % of Polymer A and 40 to 70 weight % of Polymer B; 30 to 55 weight % of Polymer A and 45 to 70 weight % of Polymer B; and 30 to 50 weight % of Polymer A and 50 to 70 weight % of Polymer B.

In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 35 to 90 weight % of Polymer A and 10 to 65 weight % of Polymer B; 35 to 85 weight % of Polymer A and 15 to 65 weight % of Polymer B; 35 to 80 weight % of Polymer A and 20 to 65 weight % of Polymer B; 35 to 75 weight % of Polymer A and 25 to 65 weight % of Polymer B; 35 to 70 weight % of Polymer A and 30 to 65 weight % of Polymer B; 35 to 65 weight % of Polymer A and 35 to 65 weight % of Polymer B; 35 to 60 weight % of Polymer A and 40 to 65 weight % of Polymer B; 35 to 55 weight % of Polymer A and 45 to 65 weight % of Polymer B; and 35 to 50 weight % of Polymer A and 50 to 65 weight % of Polymer B.

In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 40 to 90 weight % of Polymer A and 10 to 60 weight % of Polymer B; 40 to 85 weight % of Polymer A and 15 to 60 weight % of Polymer B; 40 to 80 weight % of Polymer A and 20 to 60 weight % of Polymer B; 40 to 75 weight % of Polymer A and 25 to 60 weight % of Polymer B; 40 to 70 weight % of Polymer A and 30 to 60 weight % of Polymer B; 40 to 65 weight % of Polymer A and 35 to 60 weight % of Polymer B; 40 to 60 weight % of Polymer A and 40 to 60 weight % of Polymer B; 40 to 55 weight % of Polymer A and 45 to 60 weight % of Polymer B; and 40 to 50 weight % of Polymer A and 50 to 60 weight % of Polymer B.
[00141] In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 45 to 90 weight % of Polymer A and 10 to 55 weight % of Polymer B; 45 to 85 weight % of Polymer A and 15 to 55 weight % of Polymer B; 45 to 80 weight % of Polymer A and 20 to 55 weight % of Polymer B; 45 to 75 weight % of Polymer A and 25 to 55 weight % of Polymer B; 45 to 70 weight % of Polymer A and 30 to 55 weight % of Polymer B; 45 to 65 weight % of Polymer A and 35 to 55 weight % of Polymer B; 45 to 60 weight % of Polymer A and 40 to 55 weight % of Polymer B; and 45 to 55 weight % of Polymer A and 45 to 55 weight % of Polymer B.

[00142] In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 50 to 90 weight % of Polymer A and 10 to 50 weight % of Polymer B; 50 to 85 weight % of Polymer A and 15 to 50 weight % of Polymer B; 50 to 80 weight % of Polymer A and 20 to 50 weight % of Polymer B; 50 to 75 weight % of Polymer A and 25 to 50 weight % of Polymer B; 50 to 70 weight % of Polymer A and 30 to 50 weight % of Polymer B; 50 to 65 weight % of Polymer A and 35 to 50 weight % of Polymer B; and 50 to 60 weight % of Polymer A and 40 to 50 weight % of Polymer B.

[00143] In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: greater than 50 to 99 weight % of Polymer A and 1 to less than 50 weight % of Polymer B; greater than 50 to 95 weight % of Polymer A and 5 to less than 50 weight % of Polymer B; greater than 50 to 90 weight % of Polymer A and 10 to less than 50 weight % of Polymer B; greater than 50 to 85 weight % of Polymer A and 15 to less than 50 weight % of Polymer B; greater than 50 to 80 weight % of Polymer A and 20 to less than 50 weight % of Polymer B; greater than 50 to 75 weight % of Polymer A and 25 to less than 50 weight % of Polymer B; greater than 50 to 70 weight % of Polymer A and 30 to less than 50 weight % of Polymer B; greater than 50 to 65 weight % of Polymer A and 35 to less than 50 weight % of Polymer B; greater than 50 to 60 weight % of Polymer A and 40 to less than 50 weight % of Polymer B; greater than 50 to 55 weight % of Polymer A and 45 to less than 50 weight % of Polymer B; greater than 50 to 50 weight % of Polymer A and 50 to less than 50 weight % of Polymer B; greater than 50 to 45 weight % of Polymer A and 55 to less than 50 weight % of Polymer B; greater than 50 to 40 weight % of Polymer A and 60 to less than 50 weight % of Polymer B; greater than 50 to 35 weight % of Polymer A and 65 to less than 50 weight % of Polymer B; greater than 50 to 30 weight % of Polymer A and 70 to less than 50 weight % of Polymer B; greater than 50 to 25 weight % of Polymer A and 75 to less than 50 weight % of Polymer B; greater than 50 to 20 weight % of Polymer A and 80 to less than 50 weight % of Polymer B; greater than 50 to 15 weight % of Polymer A and 85 to less than 50 weight % of Polymer B; greater than 50 to 10 weight % of Polymer A and 90 to less than 50 weight % of Polymer B; greater than 50 to 5 weight % of Polymer A and 95 to less than 50 weight % of Polymer B; greater than 50 to 0 weight % of Polymer A and 100 to less than 50 weight % of Polymer B; and greater than 50 to 0 weight % of Polymer A and 50 to less than 50 weight % of Polymer B.
of Polymer B; greater than 50 to 60 weight % of Polymer A and 40 to less than 50 weight % of Polymer B.

[00144] In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: greater than 51 to 99 weight % of Polymer A and 1 to less than 49 weight % of Polymer B; greater than 51 to 95 weight % of Polymer A and 5 to less than 49 weight % of Polymer B; greater than 51 to 90 weight % of Polymer A and 10 to less than 49 weight % of Polymer B; greater than 51 to 85 weight % of Polymer A and 15 to less than 49 weight % of Polymer B; greater than 51 to 80 weight % of Polymer A and 20 to less than 49 weight % of Polymer B; greater than 51 to 75 weight % of Polymer A and 25 to less than 49 weight % of Polymer B; greater than 51 to 70 weight % of Polymer A and 30 to less than 49 weight % of Polymer B; greater than 51 to 65 weight % of Polymer A and 35 to less than 49 weight % of Polymer B; greater than 51 to 60 weight % of Polymer A and 40 to less than 49 weight % of Polymer B.

[00145] In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 55 to 99 weight % of Polymer A and 1 to 45 weight % of Polymer B; 55 to 95 weight % of Polymer A and 5 to 45 weight % of Polymer B; 55 to 90 weight % of Polymer A and 10 to 45 weight % of Polymer B; 55 to 85 weight % of Polymer A and 15 to 45 weight % of Polymer B; 55 to 80 weight % of Polymer A and 20 to 45 weight % of Polymer B; 55 to 75 weight % of Polymer A and 25 to 45 weight % of Polymer B; 55 to 70 weight % of Polymer A and 30 to 45 weight % of Polymer B; 55 to 65 weight % of Polymer A and 35 to 45 weight % of Polymer B; and 55 to 60 weight % of Polymer A and 40 to 45 weight % of Polymer B.

[00146] In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 60 to 99 weight % of Polymer A and 1 to 40 weight % of Polymer B; 60 to 95 weight % of Polymer A and 5 to 40 weight % of Polymer B; 60 to 90 weight % of Polymer A and 10 to 40 weight % of Polymer B; 60 to 85 weight % of Polymer A and 15 to 40 weight % of Polymer B; 60 to 80 weight % of Polymer A and 20 to
40 weight % of Polymer B; 60 to 75 weight % of Polymer A and 25 to 40 weight % of Polymer B; and 60 to 70 weight % of Polymer A and 30 to 40 weight % of Polymer B.

[00147] In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 65 to 99 weight % of Polymer A and 1 to 35 weight % of Polymer B; 65 to 95 weight % of Polymer A and 5 to 35 weight % of Polymer B; 65 to 90 weight % of Polymer A and 10 to 35 weight % of Polymer B; 65 to 85 weight % of Polymer A and 15 to 35 weight % of Polymer B; 65 to 80 weight % of Polymer A and 20 to 35 weight % of Polymer B; 65 to 75 weight % of Polymer A and 25 to 35 weight % of Polymer B; and 65 to 70 weight % of Polymer A and 30 to 35 weight % of Polymer B.

[00148] In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 70 to 99 weight % of Polymer A and 1 to 30 weight % of Polymer B; 70 to 95 weight % of Polymer A and 5 to 30 weight % of Polymer B; 70 to 90 weight % of Polymer A and 10 to 30 weight % of Polymer B; 70 to 85 weight % of Polymer A and 15 to 30 weight % of Polymer B; 70 to 80 weight % of Polymer A and 20 to 30 weight % of Polymer B; 70 to 75 weight % of Polymer A and 25 to 30 weight % of Polymer B.

[00149] In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 75 to 99 weight % of Polymer A and 1 to 25 weight % of Polymer B; 75 to 95 weight % of Polymer A and 5 to 25 weight % of Polymer B; 75 to 90 weight % of Polymer A and 10 to 25 weight % of Polymer B; and 75 to 85 weight % of Polymer A and 15 to 25 weight % of Polymer B.

[00150] In certain embodiments, the polymer blends of the invention can include but are not limited to at least one of the following combinations of ranges: 80 to 99 weight % of Polymer A and 1 to 20 weight % of Polymer B; 80 to 95 weight % of Polymer A and 5 to 20 weight % of Polymer B; 80 to 90 weight % of Polymer A and 10 to 20 weight % of Polymer B.
For any of the ranges noted for Polymer A and Polymer B, it is contemplated that Polymer B can be any polymer. For any of the ranges noted for Polymer A and Polymer B, it is contemplated that Polymer B can be any type of polycarbonate. For any of the ranges noted for Polymer A and Polymer B, it is contemplated that Polymer B can be bisphenol A polycarbonate or copolyester carbonates or the polycarbonates as described in United States Patent 6,043,322, incorporated herein by reference in its entirety.

Suitable examples of the polymeric components for Polymer B include, but are not limited to, nylon; polyesters different than those described herein; polyamides such as ZYTEL® from DuPont; polystyrene; polystyrene copolymers; styrene acrylonitrile copolymers; acrylonitrile butadiene styrene copolymers; poly(methylmethacrylate); acrylic copolymers; poly(ether-imides) such as ULTEM® (a poly(ether-imide) from General Electric); polyphenylene oxides such as poly(2,6-dimethylphenylene oxide) or poly(phenylene oxide)/polystyrene blends such as NORYL 1000® (a blend of poly(2,6-dimethylphenylene oxide) and polystyrene resins from General Electric); polyphenylene sulfides; polyphenylene sulfide/sulfones; poly(ester-carbonates); polycarbonates such as LEXAN® (a polycarbonate from General Electric); bisphenol polycarbonate; polysulfones; polysulfone ethers; and poly(ether-ketones) of aromatic dihydroxy compounds; or mixtures of any of the foregoing polymers.

The blends of the invention can be prepared by conventional processing techniques known in the art, such as melt blending or solution blending. In one embodiment, polycarbonate is not present in the polyester composition. If polycarbonate is used in a blend in the polyester compositions of the invention, the blends can be visually clear. However, polyester compositions useful in the invention also contemplate the exclusion of polycarbonate as well as the inclusion of polycarbonate.

Polycarbonates useful in the invention may be prepared according to known procedures, for example, by reacting the dihydroxyaromatic compound with a carbonate precursor such as phosgene, a haloformate or a carbonate ester, a molecular weight regulator, an acid acceptor and a catalyst.
Polycarbonates useful in the invention may be any polycarbonate known in the art including but not limited to bisphenol A polycarbonates. Other useful polycarbonates can be used such as those described in U.S. Patent 6,043,322. Methods for preparing polycarbonates are known in the art and are described, for example, in U.S. Patent 4,452,933, where the disclosure regarding the preparation of polycarbonates is hereby incorporated by reference herein.

The polycarbonates useful in the polyester compositions of the invention also may be copolyestercarbonates such as those described in U.S. Patents 3,169,121; 3,207,814; 4,194,038; 4,156,069; 4,430,484, 4,465,820, and 4,981,898, where the disclosure regarding copolyestercarbonates from each of the U.S. Patents is incorporated by reference herein.

Copolyestercarbonates useful in this invention can be available commercially and/or may be prepared by known methods in the art. For example, they can be typically obtained by the reaction of at least one dihydroxyaromatic compound with a mixture of phosgene and at least one dicarboxylic acid chloride, especially isophthaloyl chloride, terephthaloyl chloride, or both.

The polycarbonates comprising component (A) of the above-described embodiment of the present invention may be prepared according to known procedures by reacting the dihydroxyaromatic compound with a carbonate precursor such as phosgene, a haloformate or a carbonate ester, a molecular weight regulator, an acid acceptor and a catalyst. Methods for preparing polycarbonates are known in the art and are described, for example, in U.S. Patent 4,452,933, which is hereby incorporated by reference herein.

Examples of suitable carbonate precursors include carbonyl bromide, carbonyl chloride, and mixtures thereof; diphenyl carbonate; a di(halophenyl)-carbonate, e.g., di(trichlorophenyl) carbonate, di(tribromophenyl) carbonate, and the like; di(alkylphenyl)carbonate, e.g., di(tolyl)carbonate; di(naphthyl)carbonate; di(chloronaphthyl)carbonate, or mixtures thereof; and bis-haloformates of dihydric phenols.

Examples of suitable molecular weight regulators include phenol, cyclohexanol, methanol, alkylated phenols, such as octylphenol, para-tertiary-
butyl-phenol, and the like. The preferred molecular weight regulator is phenol or an alkylated phenol.

[00161] The acid acceptor may be either an organic or an inorganic acid acceptor. A suitable organic acid acceptor is a tertiary amine and includes such materials as pyridine, triethylamine, dimethylaniline, tributylamine, and the like. The inorganic acid acceptor can be either a hydroxide, a carbonate, a bicarbonate, or a phosphate of an alkali or alkaline earth metal.

[00162] The catalysts that can be used are those that typically aid the polymerization of the monomer with phosgene. Suitable catalysts include tertiary amines such as triethylamine, tripropylamine, N,N-dimethylaniline, quaternary ammonium compounds such as, for example, tetaethylammonium bromide, cetyl triethyl ammonium bromide, tetra-n-heptylammonium iodide, tetra-n-propyl ammonium bromide, tetramethyl ammonium chloride, tetra-methyl ammonium hydroxide, tetra-n-butyl ammonium iodide, benzyltrimethyl ammonium chloride and quaternary phosphonium compounds such as, for example, n-butyltriphenyl phosphonium bromide and methyltriphenyl phosphonium bromide.

[00163] The polycarbonate of component (A) also may be a copolyestercarbonate such as those described in U.S. Patents 3,169,121; 3,207,814; 4,194,038; 4,156,069; 4,430,484, 4,465,820, and 4,981,898, all of which are incorporated by reference herein.

[00164] Copolyestercarbonates useful in this invention are available commercially. They are typically obtained by the reaction of at least one dihydroxyaromatic compound with a mixture of phosgene and at least one dicarboxylic acid chloride, especially isophthaloyl chloride, terephthaloyl chloride, or both.

[00165] Other polycarbonates useful in the invention are described in United States Patent 6,043,322, incorporated herein by reference.

[00166] The ratio of polyester of the invention to polycarbonate may be determined by the individual practitioner of this invention. Typically, the weight ratio of polyester of the invention to polycarbonate will range from about 99:1 to
about 1:99, preferably from about 75:25 to about 25:75, and most preferably is about 75:25 to about 50:50.

[00167]  In addition, the polyester compositions and the polymer blend compositions useful in the invention may also contain additives in any amount such as from 0.01 to 25% by weight based on the total weight of the overall composition. Common additives can be colorants, dyes, mold release agents, flame retardants, plasticizers, nucleating agents, stabilizers, including but not limited to, UV stabilizers, thermal stabilizers and/or reaction products thereof, fillers, and impact modifiers. Examples of typical commercially available impact modifiers well known in the art and useful in this invention include, but are not limited to, ethylene/propylene terpolymers, functionalized polyolefins such as those containing methyl acrylate and/or glycidyl methacrylate, styrene-based block copolymeric impact modifiers, and various acrylic core/shell type impact modifiers. Residues of such additives are also contemplated as part of the polyester composition.

[00168]  Reinforcing materials may be useful in the compositions of this invention. The reinforcing materials may include, but are not limited to, carbon filaments, silicates, mica, clay, talc, titanium dioxide, Wollastonite, glass flakes, glass beads and fibers, and polymeric fibers and combinations thereof. In one embodiment, the reinforcing materials include glass, such as, fibrous glass filaments, mixtures of glass and talc, glass and mica, and glass and polymeric fibers.

[00169]  Suitable catalysts for use in the processes of the invention to make the polyesters useful in the invention include at least one titanium compound. The polyester compositions of the invention may also comprise at least one of the titanium compounds useful in the processes of the invention. Other catalysts could possibly be used in the invention in combination with at least one titanium compound. Other catalysts may include, but are not limited to, those based on tin, gallium, zinc, antimony, cobalt, manganese, magnesium, germanium, lithium, aluminum compounds, and an aluminum compound with lithium hydroxide or
sodium hydroxide. In one embodiment, the catalyst can be a combination of at least one tin compound and at least one titanium compound.

[00170] Catalyst amounts can range from 10 ppm to 20,000 ppm or 10 to 0,000 ppm, or 10 to 5000 ppm or 10 to 1000 ppm or 10 to 500 ppm, or 10 to 300 ppm or 10 to 250 ppm based on the catalyst metal and based on the weight of the final polymer. The process can be carried out in either a batch or continuous process. In one embodiment, the catalyst is a titanium compound. In one embodiment, the catalyst is solely a titanium compound. In one embodiment, the titanium compound can be used in either the esterification reaction or the polycondensation reaction or both reactions. In another embodiment, the catalyst is solely a titanium compound useful in the polyesters useful in the esterification reaction.

[00171] When titanium is added to the polyesters and/or polyester compositions and/or process of making the polyesters of the invention, it is added to the process of making the polyester in the form of a titanium compound. The amount of the titanium compound added to the polyesters of the invention and/or polyester compositions of the invention and/or processes of the invention can be measured in the form of titanium atoms present in the final polyester, for example, by weight measured in ppm.

[00172] The polyesters in general may be prepared by condensing the dicarboxylic acid or dicarboxylic acid ester with the glycol in the presence of the titanium catalyst described herein at elevated temperatures increased gradually during the course of the condensation up to a temperature of about 225°-310 °C, in an inert atmosphere, and conducting the condensation at low pressure during the latter part of the condensation.

[00173] The invention further relates to the film(s) and/or sheet(s) comprising the polyester compositions of the invention. The methods of forming the polyesters into film(s) and/or sheet(s) are well known in the art. Examples of film(s) and/or sheet(s) of the invention including but not limited to extruded film(s) and/or sheet(s), calendered film(s) and/or sheet(s), compression molded film(s) and/or sheet(s), solution casted film(s) and/or sheet(s). Methods of making film
and/or sheet include but are not limited to extrusion, calendering, compression molding, and solution casting.

[00174] The invention further relates to bottles described herein. These bottles include, but are not limited to, injection blow molded bottles, injection stretch blow molded bottles, extrusion blow molded bottles, and extrusion stretch blow molded bottles. Methods of making bottles include but are not limited to extrusion blow molding, extrusion stretch blow molding, thermoforming, injection blow molding, and injection stretch blow molding. In each case, the invention further relates to the preforms (or parisons) used to make each of said bottles.

[00175] For the purposes of this invention, the term "wt" means "weight".

[00176] The following examples further illustrate how the polyesters of the invention can be made and evaluated, and are intended to be purely exemplary of the invention and are not intended to limit the scope thereof. Unless indicated otherwise, parts are parts by weight, temperature is in degrees C or is at room temperature, and pressure is at or near atmospheric.
EXAMPLES

The following examples illustrate in general how a polyester is prepared and the effect of using 2,2,4,4-tetramethyl-1,3-cyclobutanediol (and various cis/trans mixtures) on various polyester properties such as toughness, glass transition temperature, inherent viscosity, etc., compared to polyesters comprising 1,4-cyclohexanediol monomethyl ether and/or ethylene glycol residues, but lacking 2,2,4,4-tetramethyl-1,3-cyclobutanediol. Additionally, based on the following examples, the skilled artisan will understand how the thermal stabilizers of the invention can be used in the preparation of polyesters containing them.

Measurement Methods

The inherent viscosity of the polyesters was determined in 60/40 (wt/wt) phenol/tetrachloroethane at a concentration of 0.25 g/50 ml at 25°C, and is reported in dL/g.

Color values reported herein are CIELAB L*, a*, and b* values measured following ASTM D6290-98 and ASTM E308-99, using measurements from a Hunter Lab Ultrascan XE Spectrophotometer (Hunter Associates Laboratory Inc., Reston, VA) with the following parameters: (1) D65 illuminant, (2) 10 degree observer, (3) reflectance mode with specular angle included, (4) large area view, (5) 1" port size. The measurements were performed on polymer granules ground to pass a 6 mm sieve according to the L*, a* and b* color system of the CIE (International Commission on Illumination).

The invention has been described in detail with reference to the embodiments disclosed herein, but it will be understood that variations and modifications can be effected within the spirit and scope of the invention.
EXAMPLES

Examples based on terephthalic acid as a starting material

Example 1 - Oligomer preparation - pilot plant scale

[00182] An oligomeric material was prepared from terephthalic acid (TPA), ethylene glycol (EG), and 1,4-cyclohexanediol (CHDM). Synthesis was carried out in a 120-gallon HASLELLOY reactor which is fitted with three sets of turbine agitators and a heated reflux column. To the 120-gallon reactor under a 20 SCFH nitrogen purge and with the heated reflux column at 190 °C, 702.24 gram-moles of EG and 148.68 gram-moles of CHDM were charged. The agitator was started and the TPA was slowly added. The reactor was then pressurized to 45 psig using nitrogen gas and maintained at 45 psig throughout the esterification stage. Over a period of 14 hours and 10 minutes the temperature of the reaction mixture was ramped to 230 °C. When the reaction mixture was 230 °C at 45 psig pressure, it was held for 80 minutes. Immediately after the 80 minute hold period, the temperature of the reaction mixture was increased to 250 °C. When the reaction mixture was 250 °C at 45 psig, it was held for 70 minutes. After the 70 minute hold at 250 °C and 45 psig, the pressure was decreased to 10 psig. When the pressure was 10 psig, the reaction mixture was held at 250 °C and 10 psig for 20 minutes. After the 10 minute hold at 250 °C and 10 psig, the reactor pressure was reduced to 0 psig and the reactor was purged with 20 SCFH nitrogen. The molten reaction mixture was drained into 5-gallon open-head metal buckets. The reaction mixture was allowed to cool to 23 °C. The cooled reaction mixture was broken up and then ground in a grinder to <8-mm size.

[00183] By GC analysis the resulting oligomer material contained 68.72 mol% EG moiety, 27.37 mol% CHDM moiety, and 3.55 mol% diethylene glycol moiety.

113 grams of oligomer were used for each experiment.
**Example 2- Catalyst solution preparation**

[00184] Catalyst Solution: The catalyst used was titanium(IV) isopropoxide in ethylene glycol solution. The catalyst solution was analyzed to be 0.33 wt% in titanium.

[00185] Preparation of Merpol®A/Ethylene Glycol Solution: Merpol®A and ethylene glycol were combined in a clear 8 oz narrow-mouthed jar and magnetically stirred at 225°C for one hour to achieve a clear and colorless solution. (See Table #1)

Example 5 Polymer synthesis

PETG Catalyst Deactivation and Color Inhibition: Titanium catalyzed PETG polymers incorporating phosphorus-based compounds were prepared in a laboratory process incorporating typical polymer rigs and associated hardware. PETG oligomer and target quantities of titanium tetraisopropoxide/butanol, and phosphorus/ethylene glycol solutions were charged up front to a 500 mL round-bottom flask (See Table #4 and Table #5). Heating was accomplished using a Belmont metal bath in contact with a heating mantle. Agitation was provided by a motorized stirring system and a stainless steel one quarter inch diameter rod with an anchor shaped agitation head which was placed in a 500 ml round-bottom flask containing raw materials. The agitator was held in place by a septa equipped polymer head. Connected to the polymer head was a glass side arm through which liquids were removed during the polymerization. Liquid by-products were trapped using a 500 mL vacuum flask (condensate receiver) which was placed in a stainless steel bucket filled with dry ice. The condensate flask was connected through vacuum tubing to a dry ice/lpOH trap, which was connected by vacuum tubing to a standard lab vacuum pump. Prior to use, glassware was cleaned in a potassium hydroxide/isopropyl alcohol bath followed by an Alconox/water wash, water rinse, and drying.
The Camile monitoring and process control system provided automated control of temperature, vacuum, and agitation during the polymerization.

The following Camile sequence was executed:

</table>
The resulting PETG polymer was removed from the stir rod, chilled in liquid nitrogen, and ground to 3 mm particles in a Wiley Mill. PETG grinds were submitted for X-ray fluorescence, IV, and Appearance analysis.

**TPA based data:**

The data in the following table show that 1,2-ethylene diphosphonic acid and etridronic acid, when added at levels that lead to a similar activity of merpol A, improve polymer b\(^*\) by 30-50%.

### Example 6: DMT-based samples

The same catalyst and deactivator solutions were used for the DMT and TPA based experiments. Titanium catalyzed PETG polymers prepared from DMT and incorporating phosphorus-based catalyst deactivation/color inhibition were prepared in a laboratory process incorporating typical polymer rigs and associated hardware. Target quantities of DMT, ethylene glycol, CHDM, and titanium tetraisopropoxide/butanol were charged up front to a 500 ml round bottom flask (See Table #6 and Table #7). Heating was accomplished using a
Belmont metal bath in contact with a heating mantle. Agitation was provided by a motorized stirring system and a stainless steel one quarter inch diameter rod with an anchor shaped agitation head which was placed in a 500 ml round-bottom flask containing raw materials. The agitator was held in place by a septa equipped polymer head. Connected to the polymer head was a glass side arm through which liquids were removed during ester exchange and polymerization. Liquid by-products were trapped using a 500 ml vacuum flask (condensate receiver) which was placed in a stainless steel bucket filled with dry ice. The condensate flask was connected through vacuum tubing to a dry ice/lpOH trap, which was connected by vacuum tubing to a standard lab vacuum pump. Prior to use, glassware was cleaned in a potassium hydroxide/isopropyl alcohol bath followed by an Alconox/water wash, water rinse, and drying. The reaction flask was 50% submerged initially. Phosphorus/ethylene glycol solutions were added to the reaction flask at stage 6 of the Camile recipe, and the flask was fully submerged at stage 7 (See Camile recipe and Table #7 below).

[00194] The Camile monitoring and process control system provided automated control of temperature, vacuum, and agitation during the polymerization.

[00195] The following Camile sequence was executed:

**Blending experiments (extruder scale)**

[00197] All polyester-polycarbonate compositions were made by extruding using either 70/30 weight blend or a 50/50 by weight blend of (1) a polyester comprised of 100 mole percent terephthalic acid residues, 38 mole percent ethylene glycol residues and 62 mole percent 1,4-cyclohexanediol residues having an inherent viscosity of about 0.73 (2) a bisphenol A polycarbonate supplied by Bayer as Makrolon 2608 polycarbonate and (3) the additive concentrate noted as either Additive A, Additive B, or Additive C. All additive concentrates are based on a polyester comprised of 100 mole percent terephthalic acid residues, 38 mole percent ethylene glycol residues and 62 mole percent 1,4-cyclohexanediol residue. Additive A is 5 weight percent Weston 619 added to the polyester to make a concentrate. Additive B is 4 weight percent phosphorous acid salt added to the polyester to make a concentrate. Additive C is 2 weight percent of 1,2 ethanebisphosphonic acid added to the polyester to make a concentrate. The additives are then blended with the polyester/polycarbonate blends at various ratios to be described.

[00198] The blends were made on a 1.5" 30:1 L/D Sterling single screw compounding extruder having a medium shear screw design. All zone temperatures and adapters were set to 260 degree. C. except for Zone 1 that
was set at 240°C and the strand die that was set at 250°C. The feed zone was cooled by circulating water and the screw speed was set to 80 revolution per minute (rpm). The material was dried separately with the polyester being dried at 65 degree C for 8 hours and the polycarbonate being dried at 120 degree C for 8 hrs. The additive concentrates were dried at 65 degree C for 8 hours. The polycarbonate sample was cooled to 65 degree C prior to blending with the polyesters and the additive concentrates.

[00199] The first 5 minutes of extrudate was not collected in order to ensure the extruder had been adequately purged. When multiple concentrations of the same mixture of additives were extruded, the lower concentrations of additives always were extruded first. Samples were collected after the strands were quenched in a water bath prior to being chopped into pellets using a Conair pelletizing cutter.

[00200] The color of the polymer pellets is determined in a conventional manner using a HunterLab UltraScan Colorimeter manufactured by Hunter Associates Laboratory, Inc., Reston, Va. The instrument is operated using HunterLab Universal Software (version 3.8). Calibration and operation of the instrument is according to the HunterLab User Manual and is largely directed by the Universal Software. To reproduce the results on any colorimeter, run the instrument according to its instructions and use the following testing parameters: D65 Light Source (daylight, 6500°.K color temperature), Reflectance Mode, Large Area View, Specular Included, CIE 10°.K. Observer, Outputs are CIE L*, a*, b*. The pellets are placed in a holder that is 25 mm deep by 55 mm wide and high. The holder is black with a window on one side. During testing, the clear side of the holder is held at the reflectance port of the colorimeter as is normally done when testing in reflectance mode. An increase in the positive b* value indicates yellowness, while a decrease in the numerical value of b* indicates a reduction in yellowness. Color measurement and practice are discussed in greater detail in Anni Berger-Schunn in Practical Color Measurement, Wiley, NY pages 39-56 and 91-98 (1994). Preferably, the b* value
is less than +4, more preferably from about +1 to about +2.

Examples 7-12 and Comparative Examples 1-10

Comparative Example 1:

[00201] 70 weight percent of polyester was blended with 30 weight percent polycarbonate and extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1.

Comparative Example 2:

[00202] 70 weight percent of polyester was blended with 30 weight percent polycarbonate and 750ppm active KA201 stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1.

Comparative Example 3:

[00203] 70 weight percent of polyester was blended with 30 weight percent polycarbonate and 500ppm active KA201 stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1.

Comparative Example 4:

[00204] 70 weight percent of polyester was blended with 30 weight percent polycarbonate and 500ppm active KA202 stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1.

Comparative Example 5:

[00205] 70 weight percent of polyester was blended with 30 weight percent polycarbonate and 1000ppm active KA202 stabilizer. The blend was then
extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1.

**Example 7:**

[00206] 70 weight percent of polyester was blended with 30 weight percent polycarbonate and 250ppm active EX640-20A stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1 and shows improved \( b' \) reduction relative to comparative example 1 and similar \( b' \) reduction to the other stabilization systems even at reduced loadings.

**Example 8:**

[00207] 70 weight percent of polyester was blended with 30 weight percent polycarbonate and 500ppm active EX640-20A stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1 and shows improved \( b' \) reduction relative to comparative example 1 and similar \( b' \) reduction to the other stabilization systems even at reduced loadings.

**Example 9:**

[00208] 70 weight percent of polyester was blended with 30 weight percent polycarbonate and 1000ppm active EX640-20A stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1 and shows improved \( b' \) reduction relative to comparative example 1 and similar \( b' \) reduction to the other stabilization systems.
Comparative Example 6:

[00209] 50 weight percent of polyester was blended with 50 weight percent polycarbonate and extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1.

Comparative Example 7:

[00210] 50 weight percent of polyester was blended with 50 weight percent polycarbonate and 750ppm active KA201 stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1.

Comparative Example 8:

[00211] 50 weight percent of polyester was blended with 50 weight percent polycarbonate and 500ppm active KA201 stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1.

Comparative Example 9:

[00212] 50 weight percent of polyester was blended with 50 weight percent polycarbonate and 500ppm active KA202 stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1.

Comparative Example 10:

[00213] 50 weight percent of polyester was blended with 50 weight percent polycarbonate and 1000ppm active KA202 stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1.
Example 10:

[00214] 50 weight percent of polyester was blended with 50 weight percent polycarbonate and 250ppm active EX640-20A stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1 and shows improved b' reduction relative to comparative example 1 and similar b' reduction to the other stabilization systems even at reduced loadings.

Example 11:

[00215] 50 weight percent of polyester was blended with 50 weight percent polycarbonate and 500ppm active EX640-20A stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1 and shows improved b' reduction relative to comparative example 1 and similar b' reduction to the other stabilization systems even at reduced loadings.

Example 12:

[00216] 50 weight percent of polyester was blended with 50 weight percent polycarbonate and 1000ppm active EX640-20A stabilizer. The blend was then extruded into pellets on a Sterling extruder. The pellets were captured and color was measured on the pellets. The data can be observed in Table 1 and shows improved b' reduction relative to comparative example 1 and similar b' reduction to the other stabilization systems.

The invention has been described in detail with reference to the embodiments disclosed herein, but it will be understood that variations and modifications can be effected within the spirit and scope of the invention.
What is claimed is:

1. A polyester composition comprising:
   (I) at least one polyester which comprises:
      (a) a dicarboxylic acid component comprising:
          (i) 70 to 100 mole % of terephthalic acid residues;
          (ii) 0 to 30 mole % of aromatic dicarboxylic acid residues
               having up to 20 carbon atoms; and
          (iii) 0 to 10 mole % of aliphatic dicarboxylic acid residues
               having up to 16 carbon atoms; and
      (b) a glycol component comprising:
          (i) about 10 to about 90 mole % of ethylene glycol residues; and
          (ii) about 90 to about 10 mole % of cyclohexanediethanol residues;
   (II) residues of at least one titanium compound; and
   (III) at least one chelating phosphorus species, reaction products thereof, or mixtures thereof, represented by the structure:

   \[
   \begin{align*}
   \text{wherein:} \\
   n &= \text{an integer from 1 to 4;} \\
   R &= \text{hydrogen or } \text{CrC}_{2}\text{-alkyl;} \text{ and} \\
   R_1 \text{ and } R_2 &\text{ each can be hydrogen, } \text{C}_{2}\text{-alkyl, hydroxyl, or aryl;} \\
   \end{align*}
   \]
wherein the total mole% of the dicarboxylic acid component is 100 mole%, wherein the total mole% of the glycol component is 100 mole%; and wherein the inherent viscosity of the polyester is from 0.35 to 1.2 dL/g as determined in 60/40 (wt/wt) phenol/ tetrachloroethane at a concentration of 0.25 g/50 ml at 25°C.

2. The polyester composition of Claim 1 wherein R is hydrogen.

3. The polyester composition of Claim 1 wherein R is C₁₋₂-alkyl.

4. The polyester composition wherein R₁ is C₁₋₂-alkyl.

5. The polyester composition wherein R₁ is hydroxyl.

6. The polyester composition wherein R₂ is C₁₋₂-alkyl.

7. The polyester composition wherein R is hydrogen, R₁ is hydroxyl and R₂ is C₁₋₂-alkyl.

8. The polyester composition wherein R is hydrogen, R₁ is hydroxyl, R₂ is methyl and n is 1.

9. The polyester composition wherein R, R₁, and R₂ are each hydrogen and n equals 2.

10. The polyester composition of Claim 1 wherein the mole % of 1,4-cyclohexanedianmethanol residues is from 20 to 80 mole % and the mole % of ethylene glycol residues is from 80 to 20 mole %.
11. The polyester composition of Claim 1 wherein the mole % of 1,4-cyclohexanediol residues is from 20 to 60 mole % and the mole % of ethylene glycol residues is from 40 to 80 mole %.

12. The polyester composition of Claim 1 wherein the mole % of 1,4-cyclohexanediol residues is from 20 to 40 mole % and the mole % of ethylene glycol residues is from 60 to 80 mole %.

13. The polyester composition of Claim 1 wherein the mole % of 1,4-cyclohexanediol residues is from 25 to 40 mole % and the mole % of ethylene glycol residues is from 60 to 75 mole %.

14. The polyester composition of Claim 1, wherein said polyester has a Tg of 70 to 140°C.

15. The polyester composition of Claim 1, wherein said polyester has a Tg of 80 to 120°C.

16. The polyester composition of Claim 1, wherein the dicarboxylic acid component comprises 80 to 100 mole % of terephthalic acid residues.

17. The polyester composition of Claim 1, wherein the dicarboxylic acid component comprises 90 to 100 mole % of terephthalic acid residues.

18. The polyester composition of Claim 1, wherein said polyester comprises residues of modifying glycols.

19. The polyester composition of Claim 1, wherein said polyester comprises 2,2,4,4-tetramethyl-1,3-cyclobutanediol residues.
20. The polyester composition of Claim 1, wherein said polyester composition comprises at least one polymer chosen from at least one of the following: poly(etherimides), polyphenylene oxides, poly(phenylene oxide)/polystyrene blends, polystyrene resins, polyphenylene sulfides, polyphenylene sulfide/sulfones, poly(estercarbonates), polycarbonates, polysulfones; polysulfone ethers, or poly(ether-ketones).

Further documents are listed in the continuation of Box C. See patent family annex.

- **"A"** document defining the general state of the art which is not considered to be of particular relevance
- **"E"** earlier document but published on or after the international filing date
- **"L"** document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- **"O"** document referring to an oral disclosure, use, exhibition or other means
- **"P"** document published prior to the international filing date but later than the priority date claimed

**T** later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention

**"X"** document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone

**"Y"** document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.

**"A"** document member of the same patent family

**Date of the actual completion of the international search**
