ATTACHED REMEMBRANCE BAND FOR WEDDING RINGS

Joseph William Gittler, Philadelphia, Pa.

Application February 23, 1937, Serial No. 127,155

1 Claim. (Cl. 63—15)

My invention relates to a new and useful improvement in attached remembrance bands for wedding rings and has for one of its objects to provide a unique structure of this character wherein two narrow bands of black metal or composition are fixed to the edges of an original wedding ring indicating that the donor is deceased.

Another object of my invention is to provide a plurality of bands to be attached to the wedding ring, by means of cement, glue or ground in, to symbolize the sacredness of an original wedding ring and to be worn as a sign of grief for the departed spouse.

With these ends in view, this invention consists of the details of construction and combination of elements hereinafter set forth and then designated by the claim.

In order that those skilled in the art to which this invention appertains may understand how to make and use the same I will describe its construction in detail, referring by numerals to the accompanying drawing forming a part hereof, in which:—

The figure is a perspective view of a wedding ring with the remembrance or mourning bands attached thereto.

In carrying out my invention as herein embodied 2 represents the original wedding ring of any usual or well known style or type and 3 denotes the additional narrow bands of black metal or composition securely attached to the two edges of the wedding ring by means of a suitable adhesive, such as cement or glue, or ground in.

From the foregoing it is obvious that the three parts shown form a single unit, each part being firmly joined to another. The novel structure thus produced is to be worn by the surviving spouse as a token of mourning.

Of course I do not wish to be limited to the exact details of construction herein shown as these may be varied within the scope of the appended claim without departing from the spirit of my invention.

I claim:

A device of the kind described comprising a wedding ring, and two bands of exactly the same inner and outer diameters as the wedding ring at its edges, each of said bands being secured to an edge of the wedding ring to produce a unitary structure with the inner and outer circumferential surfaces of the ring and bands flush with one another throughout.

JOSEPH W. GITTLER.
