DESCRIPTION

2-HETEROARYL-SUBSTITUTED BENZIMIDAZOLE DERIVATIVE

5 TECHNICAL FIELD

The present invention relates to a glucokinase activator comprising, as the active ingredient thereof, a 2-heteroaryl-substituted benzimidazole derivative and useful in the field of medicines. Further, it relates to a novel 2-heteroaryl-substituted benzimidazole derivative.

10 BACKGROUND ART

Glucokinase (GK) (ATP: D-hexose 6-phosphotransferase, EC 2.7.1.1) is one (hexokinase IV) of four mammal hexokinases. Hexokinase is a first-stage enzyme in glycolysis and catalyzes a reaction from glucose to glucose hexaphosphate. In its expression, glucokinase is limited essentially in liver and pancreas beta cells, and it controls the rate-limiting step of glucose metabolism in these cells thereby playing an important role in systemic saccharometabolism. Glucokinase in liver beta cells and that in pancreas beta cells differ from each other in point of the N-terminal 15-amino acid sequence owing to the difference in splicing therebetween, but they are the same in point of the enzymatic property. The enzymatic activity of the other three hexokinases (I, II, III) except glucokinase is saturated at a glucose concentration of at most 1 mM, but Km of glucokinase to glucose is 8 mM and is near to a physiological blood-sugar level. Therefore, in accordance with the blood-sugar level change from a normal blood-sugar level (5 mM) to an increased blood-sugar level after meals (10 to 15 mM), intercellular glucose metabolism is accelerated via glucokinase.

Since ten years ago, a hypothesis that glucokinase may act as a glucose sensor in pancreas beta cells and liver has been proposed [for example, see Garfinkel D. et al., Computer modeling identifies glucokinase as glucose sensor of pancreatic beta-cells; American Journal Physiology, Vol. 247 (3Pt2), 1984, pp. 527-536].

A result of recent glucokinase gene-manipulated mice has confirmed that glucokinase actually plays an important role in systemic glucose homeostasis. Mice in which the glucokinase gene was disrupted die soon after their birth [for example, see Grupe A. et al., Transgenic knockouts reveal a critical requirement for pancreatic beta cell glucokinase in maintaining glucose homeostasis; Cell, Vol. 83, 1995, pp. 69-78]; but on the other hand, normal or diabetic mice in which glucokinase was excessively expressed have a lowered blood-sugar level [for example, see Ferre T. et al., Correction of diabetic alterations by glucokinase; Proceedings of the National Academy of Sciences of the U.S.A., Vol. 93, 1996, pp. 7225-7230].

With the increase in glucose concentration therein, the reaction of pancreas beta cells and that of liver cells are both toward the reduction in a blood-sugar level, though differing from each other.
Pancreas beta cells come to secrete more insulin, and liver takes up sugar to store it as glycogen therein and simultaneously reduces sugar release.

To that effect, the change in the enzymatic activity of glucokinase plays an important role in mammal glucose homeostasis via liver and pancreas beta cells. In a juvenile diabetic case that is referred to as MODY2 (maturity-onset diabetes of the young), mutation of a glucokinase gene has been found, and the glucokinase activity reduction causes the blood-sugar level increase [for example, see Vionnet N. et al., Nonsense mutation in the glucokinase gene causes early-onset non-insulin-dependent diabetes mellitus; Nature Genetics, Vol. 356, 1992, pp. 721-722].

On the other hand, a pedigree having mutation of increasing glucokinase activity has been found, and those of the family line show low blood-sugar level symptoms [for example, see Glaser B. et al., Familial hyperinsulinism caused by an activating glucokinase mutation; New England Journal Medicine, Vol. 338, 1998, pp. 226-230].

From these, glucokinase acts as a glucose sensor and plays an important role in glucose homeostasis also in humans. On the other hand, blood-sugar level control by utilizing a glucokinase sensor system may be possible in many type-II diabetes patients. A glucokinase-activating substance may be expected to have an insulin secretion promoting effect in pancreas beta cells and have a sugar take-up accelerating and sugar release inhibiting activity in liver, and therefore it may be useful as a remedy for type-II diabetes patients.

Recently, it has become clarified that pancreas beta cell-type glucokinase is limitedly expressed locally in rat brains, especially in ventromedial hypothalamus (VMH) thereof. About 20% neurocytes in VMH are referred to as glucose-responsive neurons, and heretofore it has been considered they may play an important role in body weight control. When glucose is administered to a rat brain, then it reduces the amount of ingestion; but when glucose metabolism is retarded through intracerebral administration of glucosamine, a glucose analogue, then it causes hyperphagia. From an electrophysiological experiment, it is admitted that glucose-responsive neurons are activated in accordance with a physiological glucose concentration change (5 to 20 mM), but when glucose metabolisms is inhibited by glucosamine or the like, then their activity is retarded. In the glucose concentration-sensitive system in VMH, a glucose-mediated mechanism is anticipated like the insulin secretion in pancreas beta cells. Accordingly, there may be a possibility that a substance for glucokinase activation in VMH, in addition to liver and pancreas beta cells, may be effective not only for blood-sugar level correction but also for solution of obesity that is problematic in many type-II diabetes patients.

From the above description, a compound having a glucokinase activation effect is useful for remedies and/or preventives for diabetes, or for remedies and/or preventives for chronic complications of diabetes such as retinopathy, nephropathy, neurosis, ischemic cardiopathy, arteriosclerosis, and further for remedies and/or preventives for obesity.

For benzimidazole derivatives, for example, a compound of the following formula is described
The compound of the above formula has a substituent at the 2-position of the benzimidazole skeleton thereof, but the substituent is 4-chlorophenyl and differs from the ring A in the present invention.

Further, the use of the compound is for an interleukin production inhibitor, and there is given neither description indicating that the compound may be useful for remedy and/or prevention of diabetes nor description suggesting it.

For benzimidazole compounds, for example, also described is a compound of the following formula (for example, see WO2004017963):

The compound of the above formula has only one substituent on the benzene ring of the benzimidazole skeleton thereof, and though it has a substituent at the 2-position of the benzimidazole skeleton, the substituent is 5-chlorothienyl and differs from the ring A in the present invention.

Further, the use of the compound is for a factor Xa and factor VIIa inhibitor, and there is given neither description indicating that the compound may be useful for remedy and/or prevention of diabetes nor description suggesting it.

The novel 2-heteroaryl-substituted benzimidazole derivatives of the invention may be in the form of their pharmaceutically-acceptable salts. The salts include acid-addition salts and base-addition salts.

Depending on the type of the substituents therein, the compounds of the invention include stereoisomers and tautomers such as optical isomers, diastereomeric isomers and geometrical isomers. Needless-to-say, the compounds of the invention include all these isomers. Further needless-to-say, the compounds of the invention include all mixtures of such isomers.

Since the compounds of the invention have a glucokinase-activating effect, they are useful as remedies and/or preventives for diabetes and further as remedies and/or preventives for complications of diabetes.

Complications of diabetes as referred to herein are meant to indicate diseases complicated by diabetes, including, for example, diabetic nephropathy, diabetic retinopathy, diabetic neuropathy, diabetic arteriosclerosis.

The compounds of the invention are applicable to both types of diabetes, insulin-dependent diabetes mellitus (IDDM) and non-insulin-dependent diabetes mellitus (NIDDM).

Insulin-dependent diabetes mellitus (IDDM) is developed by predispositions to genetic insulin secretion reduction and insulin resistance in skeletal muscle, as promoted by obesity-caused insulin resistance, and is essentially considered as adult-onset diabetes.

The compounds of the invention are considered useful not only for type I insulin-dependent diabetes mellitus but also for type II diabetes for which conventional medicines are ineffective for sufficiently lowering the blood-sugar level.

In type II diabetics, the degree of high blood-sugar level after meals lasts remarkably longer than that in healthy persons, but the compounds and their pharmaceutically-acceptable salts of the invention are useful also for type II diabetes.

In addition, the compounds and their pharmaceutically-acceptable salts of the invention are useful for remedy and/or prevention of obesity.

The compounds of the following formula (I-0) of the invention:

$$\text{(I-0)}$$

[in the formula, the symbols have the same meanings as above] may be produced, for example, according to the following method:
(Step 1)

This step is a process for reacting a compound (1) with a compound (A) represented by $R_1^1-X_5^1 H$ in the presence of a base to produce a compound (2).

$L_1^1$ and $L_2^2$ more concretely include, for example, halogens such as fluorine, chlorine, bromide. $L_1^1$ and $L_2^2$ may be the same or different.

The compound (1) for use in this step includes, for example, 3,5-difluoro-2-nitroaniline, 3,5-dichloro-2-nitroaniline, 3,5-dibromo-2-nitroaniline, 4-bromo-5-fluoro-2-nitroaniline, 4,5-difluoro-2-nitroaniline.

The amount of the compound (A) to be used varies depending on the type of the compound and the solvent used and on the other reaction conditions, but may be generally from 0.1 to 20 equivalents, preferably from 0.5 to 5 equivalents relative to one equivalent of the compound (1).

The amount of the base to be used also varies depending on the type of the compound and the solvent used and on the other reaction conditions, but may be generally from 0.1 to 20 equivalents, preferably from 0.5 to 5 equivalents.

The base to be used may be any one capable of producing a compound (2) through the reaction of the compound (1) with $R_5^5-X_5^5 H$ in this step, including, for example, sodium hydride, cesium carbonate, sodium carbonate, potassium carbonate, potassium phosphate, potassium acetate, potassium tert-butyrate, triethylamine. When $R_5^5-X_5^5 H$ is a primary or secondary amine, then the base may not be used.

The reaction solvent to be used may be an inert solvent, not specifically defined so far as it does not interfere with the reaction. Concretely, for example, it includes pyridine, toluene, tetrahydrofuran,
1,4-dioxane, N,N-dimethylformamide, N,N-dimethylacetamide, dimethylsulfoxide, 1-methyl-2-pyrrolidinone.

The reaction temperature in this step may be generally from 0 to 250°C, preferably from 0 to 150°C.

The reaction time in this step may be generally from 0.1 to 72 hours, preferably from 0.5 to 5 hours.

The compound (2) thus obtained may be subjected to the next step, after isolated and purified in any known manner for isolation and purification, for example, through concentration, concentration under reduced pressure, crystallization, solvent extraction, reprecipitation, chromatography, or not after isolated and purified.

(Step 2)

This step is a process for producing a compound (3) by reacting the compound (2) obtained in the previous step 1 with a compound (A) which is the same as or different from that in the step 1, in the presence of a base.

This step may be carried out in the same manner as in the step 1 or in accordance with the method of the step 1 or by combining it with an ordinary method.

(Step 3)

This step is a process for producing a compound (4) by reducing the nitro group in the compound (3) obtained in the previous step 2.

For the reduction in this step, employable is any method well known by those skilled in the art. The reduction in this step concretely includes, for example, catalytic reduction using hydrogen, formic acid, ammonium formate, hydrazine hydrate and a palladium, platinum, nickel catalyst; reduction using hydrochloric acid, ammonium chloride and iron; and reduction using methanol and tin chloride.

The amount of the reducing agent to be used for the reduction varies depending on the type of the compound and the solvent used and on the other reaction conditions, but may be generally from 1 to 50 equivalents, preferably from 2 to 20 equivalents relative to one equivalent of the compound (3).

The reaction solvent to be used is not specifically defined so far as it does not interfere with the reaction. For it, for example, herein employable are methanol, N,N-dimethylformamide, ethyl acetate, tetrahydrofuran and their mixed solvents.

The reaction temperature and the reaction time are not specifically defined. At a reaction temperature of from -10 to 100°C or so, preferably from 0 to 50°C or so, the reaction may be effected for 1 to 20 hours or so, preferably for 1 to 5 hours or so.

The compound (4) thus obtained may be subjected to the next step, after isolated and purified in any known manner for isolation and purification, for example, through concentration, concentration under reduced pressure, solvent extraction, crystallization, reprecipitation, chromatography, or not after isolated and purified.
(Step 4)

This step is a process for producing a compound (I) by reacting the compound (4) obtained in the previous step 3 with a compound (5).

The cyclization in this step may be effected in any method described in references (for example, Synthesis, 2000, Vol. 10, pp. 1380-1390), or in accordance with it, or by combining it with an ordinary method.

The compound (5) to be used includes, for example, pyridinecarboxaldehyde, pyrazinecarboxaldehyde, 1H-pyrazole-3-carboxyaldehyde.

The amount of the compound (5) to be used may be generally from 0.1 to 100 equivalents, preferably from 0.1 to 3 equivalents.

The reaction solvent to be used in this step is not specifically defined so far as it does not interfere with the reaction. For it, for example, herein employable are nitrobenzene, methanol, tetrahydrofuran, N,N-dimethylformamide, toluene, and mixtures of those solvents.

The reaction temperature may be generally from 0°C to the reflux temperature of the reaction solvent, preferably from room temperature to the reflux temperature of the reaction solvent.

The reaction time may be generally from 0.1 to 72 hours, preferably from 0.1 to 24 hours.

The compound (I) of the invention thus obtained may be isolated and purified in any known manner for isolation and purification, for example, through concentration, concentration under reduced pressure, solvent extraction, crystallization, reprecipitation, chromatography.

(Step 5-1)

This step is a process for producing a condensed product by reacting the compound (4) obtained in the step 3 with a compound (6).

The amidation in this step may be carried out, using a carboxylic acid or its reactive derivative for the compound (6), and the compound (4).

The amount of the compound (6) or its reactive derivative to be used may be generally from 0.1 to 100 equivalents, preferably from 0.1 to 3 equivalents.

The "reactive derivative" of the compound (6) includes, for example, mixed acid anhydrides, active esters, active amides, and these may be obtained, for example, according to the method described in WO98/05641.

In the above reaction, when a carboxylic acid for the compound (6) is used, then the reaction is preferably effected in the presence of a condensing agent, for example, carbonyldiimidazole, N,N'-dicyclohexylcarbodiimide, 1-ethyl-3-(3-dimethylaminopropyl)carbodiimide, diphenylphosphorylamine, dipyridyl disulfide-triphenyl phosphine, preferably carbonyldiimidazole.

Not strictly limited, the amount of the condensing agent to be used may be generally from 0.1 to 100 equivalents, preferably from 0.1 to 10 equivalents relative to the compound (6).

The reaction may be effected generally in an inert solvent. The inert solvent includes, for
example, tetrahydrofuran, N,N-dimethylformamide, 1,4-dioxane, benzene, toluene, methylene chloride, chloroform, carbon tetrachloride, 1,2-dichloroethane, pyridine, or mixtures of those solvents.

The reaction temperature may be generally from 0°C to the reflux temperature of the reaction solvent used, preferably from room temperature to the reflux temperature of the reaction solvent.

The reaction time may be generally from 0.1 to 72 hours, preferably from 0.5 to 24 hours.

In order to smoothly promote it, the reaction may be effected in the presence of a base and a condensation promoter.

The base includes 4-dimethylaminopyridine, triethylamine.

The amount of the base to be used may be generally from 0.1 to 100 equivalents, preferably from 0.1 to 1 equivalent relative to one mol of the carboxylic acid or its reactive derivative for the compound (6).

The condensation promoter includes N-hydroxybenzotriazole hydrate, N-hydroxysuccinimide.

The amount of the condensation promoter to be used may be generally from 1 to 100 equivalents, preferably from 1 to 5 equivalents relative to one mol of the carboxylic acid or its reactive derivative for the compound (6).

In the reaction, when an amino group or an imino group not participating in the reaction exists in the reactants, it is desirable that the amino group or the imino group is suitably protected with a protective group for the amino group or the imino group, then the reaction is carried out, and the protective group is removed after the reaction.

Thus obtained, the condensation product may be subjected to the next step, after isolated and purified in any known manner for isolation and purification, for example, through concentration, concentration under reduced pressure, solvent extraction, crystallization, reprecipitation, chromatography, or not after isolated and purified.

(Step 5-2)

This step is a process for producing a compound (I-0) through cyclization of the condensation product obtained in the previous step 5-1.

The cyclization in this step may be effected in any method described in references (for example, the method described in Tetrahedron, 2001, Vol. 57, No. 9, pp. 1793-1800), or in accordance with it, or by combining it with an ordinary method.

When p-toluenesulfonic acid is used in the cyclization, then the amount of p-toluenesulfonic acid to be used may be generally from 0.1 to 100 equivalents, preferably from 0.1 to 1 equivalent.

The reaction solvent to be used in this step is not specifically defined so far as it does not interfere with the reaction. For it, for example, herein employable are toluene, N,N-dimethylformamide, 1,4-dioxane, N-methylpyrrolidinone, or mixtures of those solvents.

The reaction temperature may be generally from 0 to 200°C, preferably from room temperature to the reflux temperature of the reaction solvent used.
The reaction time may be generally from 0.1 to 72 hours, preferably from 0.5 to 12 hours.

The compound (I-0) of the invention thus obtained may be isolated and purified in any known manner for isolation and purification, for example, through concentration, concentration under reduced pressure, solvent extraction, crystallization, reprecipitation, chromatography.

The compounds (I-11) of the invention may also be produced according to the following method:

\end{align*}

This step is a process for producing a compound (48) by reacting the compound (47) with a compound (G). L represents a leaving group, and may be the same as the above-mentioned L₁ and L₂. The compound (G) concretely includes, for example, benzyl bromide, 4-fluoro-benzonitrile, 4-fluoro-benzaldehyde. The reaction in this step may be carried out in the same manner as in the step 27, or in accordance with it, or by combining it with an ordinary method. The compound (48) thus obtained may be subjected to the next step, after isolated and purified in any known manner for isolation and purification, for example, through concentration, concentration under reduced pressure, crystallization, solvent extraction, reprecipitation, chromatography, or not after isolated and purified.  

(Step 48)  

This step is a process for producing a compound (49) by removing the carboxyl-protective group Rp³ in the compound (48). The carboxyl-protective group in the compound (48) may be any one capable of acting as a protective group for carboxyl in the previous steps 44 to 47 and capable of being readily removed in the step 48. For example, it includes a linear or branched lower alkyl such as methyl, ethyl, tert-butyl; a halogeno-lower alkyl such as 2-iodomethyl, 2,2,2-trichloroethyl; a lower alkenyl such as allyl, 2-propenyl, 2-methyl-2-propenyl; and an aralkyl such as benzyl, para-methoxy-benzyl.  

The introduction and the removal of the carboxyl-protective group Rp³ may be effected in any method described in references (for example, Protective Groups in Organic Synthesis, by T. W. Green, 2nd Ed., John Wiley & Sons, 1991), or in accordance with it, or by combining it with an ordinary method.  

The compound (49) thus obtained may be subjected to the next step, after isolated and purified in any known manner for isolation and purification, for example, through concentration, concentration under reduced pressure, solvent extraction, crystallization, reprecipitation, chromatography, or not after isolated and purified. If desired, Rp³ may be converted.  

(Step 49)  

This step is a process for producing a compound (50) by reacting the compound (49) with a compound (H), and, for example, this is so-called Curtius transition reaction. Briefly, using a phosphoric acid azide compound and an alcoholic compound (17-1) in the presence of a base, the reaction may be effected in any method described in references (for example, Tetrahedron, Vol. 31, 1974, pp. 2151-2157), or in accordance with it, or by combining it with an ordinary method.  

The amount of the alcoholic compound (H) to be used varies, depending on the type of the
compound and the solvent used and on the other reaction conditions, but may be generally from 0.1 to 20 equivalents, preferably from 0.5 to 5 equivalents relative to one equivalent of the compound (49).

The amount of the base to be used also varies, depending on the type of the compound and the solvent used and on the other reaction conditions, but may be generally from 0.1 to 20 equivalents, preferably from 0.5 to 5 equivalents.

The phosphoric acid azide compound to be used may be any one capable of producing the compound (50) through the reaction of the compound (49) with the compound (H) in this step. For example, it includes diethylphosphoric acid azide, diphenylphosphoric acid azide.

The base to be used may be any one capable of producing the compound (50) through the reaction of the compound (49) with the compound (H) in this step. For example, it includes sodium hydride, cesium carbonate, sodium carbonate, potassium carbonate, potassium phosphate, potassium acetate, potassium tert-butoxide, triethylamine.

The reaction solvent to be used in this step is not specifically defined so far as it does not interfere with the reaction. For example, it includes toluene, tetrahydrofuran, methylene chloride, chloroform, 1,4-dioxane, benzene.

The reaction temperature in this step may be generally from 0°C to the reflux temperature of the reaction solvent used, preferably from room temperature to 150°C.

The reaction time in this step may be generally from 0.1 to 72 hours, preferably from 0.5 to 12 hours.

The compound (50) thus obtained may be subjected to the next step, after isolated and purified in any known manner for isolation and purification, for example, through concentration, concentration under reduced pressure, crystallization, solvent extraction, reprecipitation, chromatography, or not after isolated and purified.

(Step 50)

This step is a process for producing the compound (40) by introducing a nitro group into the compound (50). The reaction in this step may be carried out in the same manner as in the step 29, or in accordance with it, or by combining it with an ordinary method.

After or not after isolated and purified in any known manner for isolation and purification, for example, through concentration, concentration under reduced pressure, crystallization, solvent extraction, reprecipitation, chromatography, the compound (40) thus obtained may be processed according to the above-mentioned steps 40 to 43 to thereby produce a compound (I-3) of the invention.

The compounds (I-31) of the invention may also be produced in a different process in which, after Rp is removed from the compound (50) to give the aniline derivative and after the aniline derivative is reacted with the compound (6), a nitro group is introduced into the reaction product, and finally the nitro group is reduced to an amino group simultaneously with cyclization of the resulting compound, or, if desired, the compound is separately cyclized.
The amidation of the compound (50) and the compound (6), the nitration, the reduction from the nitro group into an amino group, and the cyclization may be effected in the same manner as in the step 5-1, the step 13, the step 3 and the step 5-1, respectively, or in accordance with it, or by combining it with an ordinary method. The removal of Rp⁴ may be effected in the same manner as in the above-mentioned method (Protective Groups in Organic Synthesis, by T. W. Green, 2nd Ed., John Wiley & Sons, 1991), or in accordance with it, or by combining it with an ordinary method.

The novel 2-heteroaryl-substituted benzimidazole derivatives that the invention provides may be in the form of their pharmaceutically-acceptable salts. The salts may be produced in any ordinary method from the compounds (I-0) of the invention and from the compounds of the above-mentioned formulae (I-1), (I-11), (I-12), (I-2), (I-11-0), (I-31) and (I-4) that are within the scope of the compounds (I-0).

Concretely, when the compounds (I-0), (I-1), (I-11), (I-12), (I-2), (I-11-0), (I-31) and (I-4) have a basic group derived from, for example, an amino group or a pyridyl group in the molecule, then the compounds may be processed with acid so as to convert them into the corresponding pharmaceutically-acceptable salts.

The acid-addition salts include, for example, hydrohalides such as hydrochlorides, hydrofluorides, hydrobromides, hydroiodides; inorganic acid salts such as nitrates, perchlorates, sulfates, phosphates, carbonates; lower alkylsulfonates such as methanesulfonates, trifluoromethanesulfonates, ethanesulfonates; arylsulfonates such as benzenesulfonates, p-toluensulfonates; organic acid salts such as fumarates, succinates, citrates, tartrates, oxalates, maleates; other organic acid-addition salts with amino acid such as glutamates, aspartates. When the compounds of the invention have an acid group in the molecule, for example, when they have a carboxyl group, then the compounds may be processed with a base so as to convert them into the corresponding pharmaceutically-acceptable salts. The base-addition salts include, for example, alkali metal salts with sodium or potassium; alkaline earth metal salts with calcium or magnesium; ammonium salts; organic base-addition salts with guanidine, triethylamine, dicyclohexylamine, etc. In addition, the compounds of the invention may also be in any other form of hydrates or solvates of their free compounds or their salts.

In producing medicines for prevention and remedy of type II diabetes or diseases or symptoms associated with it, the compounds of formula (I) of the invention may be combined with carrier substances.

The dose of the compounds of formula (I) of the invention for prevention or remedy of diseases naturally varies, depending on the property of the symptom to be treated, the specific compound selected for it and the administration route.

In addition, the dose also varies depending on the age, the body weight and the sensitivity of patients. In general, the daily dose for one-time or plural-times administration may be from about 0.001 mg/kg-body weight to about 100 mg/kg-body weight, preferably from about 0.01 mg/kg-body weight to
about 50 mg/kg-body weight, even more preferably from about 0.1 mg/kg-body weight to about 10 mg/kg-body weight. As the case may be, administration of a dose over the range may be necessary.

An example of a suitable dose for oral administration is described. The daily dose for one-time or two- to four-times administration may be at least from about 0.01 mg to at most 2.0 g. Preferably, the daily administration frequency is once or twice a day, and the daily dose is from about 1.0 mg to about 200 mg. More preferably, the daily dose is from about 10 mg to 100 mg for one-time administration a day.

For intravenous administration or oral administration, a typical dose of the compound (I) may be from about 0.001 mg/day/g-body weight to about 100 mg/day/g-body weight (preferably from 0.01 mg/day/g-body weight to about 10 mg/day/g-body weight), more preferably from about 0.1 mg/day/g-body weight to 10 mg/day/g-body weight.

As so mentioned hereinafore, the pharmaceutical composition of the invention comprises a compound of formula (I) and a pharmaceutically-acceptable carrier. The term "composition" is meant to contain not only a product produced by directly or indirectly combining, hybridizing or aggregating 2 or more any ingredients, a product produced as a result of dissociation of one or more ingredients, or a compound produced as a result of reaction or interaction of different types of ingredients, but also an active and inactive ingredient of constituting a carrier (pharmaceutically-acceptable vehicle).

As combined with a pharmaceutically-acceptable carrier, the composition of the invention preferably contains a compound of formula (I) in an amount effective for remedy and prevention of type II diabetes and for retardation of the onset of the disease.

For administering the effective dose of the compound of the invention to mammals, especially to humans, employable is any suitable administration route. For example, the route may be oral administration, rectal administration, local administration, intravenous administration, ophthalmic administration, lung administration or nasal administration. Examples of the administration forms are tablets, troches, powders, suspensions, solutions, capsules, creams, aerosols. Preferred are oral tablets.

In preparing oral compositions, usable are any ordinary pharmaceutical media. Their examples are water, glycol, oil alcohol, fragrant additives, preservatives, colorants. In preparing liquid compositions for oral administration, for example, mentioned are suspensions, elixirs and solutions. Their carriers are, for example, starch, sugar, microcrystalline cellulose, diluent, granulating promoter, lubricant, binder, disintegrator. In preparing solid compositions for oral administrations, for example, mentioned are powders, capsules and tablets. Above all, such solid compositions for oral administration are preferred.

In view of the easiness in their administration, tablets and capsules are the most advantageous forms for oral administration. If desired, the tablets may be coated according to standard aqueous or non-aqueous coating techniques.

In addition to the above-mentioned ordinary administration modes for them, the compounds of
formula (I) may also be administered according to controlled release systems and/or controlled delivery systems, for example, as in US Patents 3,845,770, 3,916,899, 3,536,809, 3,598,123, 3,630,200 and 4,008,719.

The pharmaceutical composition of the invention suitable for oral administration includes capsules, cashews and tablets that contain a predetermined amount of the active ingredient in the form of powders or granules thereof, or in the form of water-soluble liquids, water-insoluble liquids, oil-in-water emulsions or water-in-oil emulsions thereof. These compositions may be prepared in any pharmaceutical methods, and all the methods include a process of combining the active ingredient with a carrier of one or more necessary ingredients.

In general, the active ingredient is uniformly and fully mixed with a liquid carrier, or a well-separated solid carrier or with both the two, and then, if desired, the product is shaped into suitable forms to prepare the composition. For example, tablets are produced through compression and shaping, optionally along with one or more side components. Using a suitable machine, compressed tablets may be produced by mixing the active ingredient optionally with binder, lubricant, inert vehicle, surfactant or dispersant and compressing the resulting mix in any desired manner into powder or granules.

The shaped tablets are prepared by shaping the mixture of the powdery wet compound and an inert liquid diluent, using a suitable machine.

Preferably, the tablets each contain from about 1 mg to 1 g of the active ingredient; and the cashews and the capsules each contain from about 1 mg to 500 mg of the active ingredient.

Examples of the administration modes of the compounds of formula (I) for pharmaceutical use are as follows:

The compounds of formula (I) may be used, as combined with any other medicines usable not only for type II diabetes-associated diseases or symptoms but also for remedy/prevention/retardation of the onset of type II diabetes. The additional medicines may be administered in any administration route and dose generally employed in the art, simultaneously with or separately from the compound of formula (I).

In case where the compound of formula (I) is used along with one or more other medicines, then a pharmaceutical composition comprising the compound of formula (I) and the additional medicines is preferred. Accordingly, the pharmaceutical composition of the invention may comprise not only the compound of formula (I) but also one or more such active ingredients. Examples of the active
ingredients that may be combined with the compounds of formula (I) are mentioned below, which, however, are not limitative. These may be separately administered or may be administered simultaneously as contained in the same pharmaceutical composition.

(a) bis-guanides (e.g., buformin, metoformin, fenformin),
(b) PPAR agonists (e.g., triglytazon, pioglytazon, nosiglytazon),
(c) insulin,
(d) somatostatin,
(e) α-glucosidase inhibitors (e.g., boglybose, miglytol, acarbose),
(f) insulin secretion promotors (e.g., acetohexamide, calbutamide, chlorpropamide, glybomlide, glycrazide, glymerpide, glypidide, glyquidine, glysoxepide, glyburide, glyhexamide, glypinamide, fenbutamide, trazamide, tolbutamide, tolcyclamid, nateglynine, repaglyidine), and
(g) DPP-IV (dipeptidyl peptidase IV) inhibitors.

The weight ratio of the compound of formula (I) to the second active ingredient may vary within a broad range, and depends on the effective amount of the individual active ingredients. Accordingly, for example, when the compound of formula (I) is combined with a PPAR agonist, then the weight ratio of the compound of formula (I) to the PPAR agonist may be generally from about 1000/1 to 1/1000, preferably from about 200/1 to 1/200. The combination of the compound of formula (I) and the other active ingredient may be within the above-mentioned range. In any case, an effective amount of the individual ingredients should be in the combination.

The glucokinase-activating potency of the compounds of formula (I) of the invention and a test method for it are described below.

The excellent glucokinase-activating effect of the compounds of formula (I) may be determined by a method described in references (for example, Diabetes, Vol. 45, pp. 1671-1677, 1996), or in accordance with it.

The glucokinase activity may be determined not by directly measuring glucose-6-phosphate but by measuring the level of Thio-NADH, which is produced when a reporter enzyme, glucose-6-phosphate dehydrogenase produces phosphogluconolactone from glucose-6-phosphate, and based on the level, the degree of glucokinase activity of the compound tested may be determined.

In this assay, used was a recombinant human liver GK, which was expressed by E. coli as a FLAG fusion protein therein and was purified by ANTIFLAG M2 AFFINITY GEL (Sigma).

Using a 96-well plate, the assay was carried out at 30°C. 69 µl of an assay buffer (25 mM Hepes Buffer/pH = 7.2, 2 mM MgCl2, 1 mM ATP, 0.5 mM TNAD, 1 mM dithiothreitol) was put into the plate, and 1 µl of a DMSO solution of the compound or DMSO alone as a control was added thereto. Next, 20 µl of an enzyme mixture (FLAG-GK, 20U/ml G6PDH) cooled in ice was added to it, and 10 µl of a substrate, 25 mM glucose was added to it, and the reaction was initiated (final glucose concentration = 2.5 mM).
After the start of the reaction, the increase in the absorbance at 405 nm was measured for 10 minutes at intervals of 30 seconds, and the increase for the first 5 minutes was used for evaluating the compound tested. FLAG-GK was added so that the absorbance increase after 5 minutes in the presence of 1% DMSO could be from 0.05 to 1.0.

The OD level of the DMSO control was set as 100%; and the OD level of the test compound at different concentrations was determined. From the OD level at each concentration, Emax (%) and EC50 (μM) were computed and used as the index of the GK-activating potency of the compound.

The GK-activating potency of the compounds of the invention was measured according to the method as above, and the results are shown in Table 1 below.

Example 1:
2-Pyridin-2-yl-5,6-bis(pyridin-3-yloxy)-1H-benzimidazole

(Step 1) Production of 3-(2-fluoro-4-nitro-phenoxy)-pyridine:

2.09 g of 3-hydroxy pyridine and 5.52 g of potassium carbonate were added to a dimethylformamide (20 ml) solution of 3.18 g of 3,4-difluoronitrobenzene, and the reaction liquid was stirred at 90°C for 1 hour. The reaction liquid was diluted with ethyl acetate, washed with water and saturated saline in order, and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 9/1) to obtain the entitled compound.

(Step 2) Production of 5-fluoro-2-nitro-4-(pyridin-3-yloxy)-phenylamine:

1.0 g of 20 % palladium hydroxide-carbon catalyst was added to a methanol (30 ml) solution of 4.72 g of 3-(2-fluoro-4-nitro-phenoxy)-pyridine, and the reaction liquid was stirred in a hydrogen atmosphere for 5 hours. The catalyst was removed through filtration, and the solvent was evaporated away under reduced pressure to obtain a crude product. 1.88 g of potassium nitrate was added to a trifluoroacetic acid (40 ml) solution of the resulting crude product, and the reaction liquid was stirred overnight at room temperature. Then, the solvent was evaporated away under reduced pressure. The residue was diluted with ethyl acetate, washed with saturated sodium bicarbonate solution and saturated saline in order, and then dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 4/1) to obtain the entitled compound.

(Step 3) Production of 4,5-bis(pyridin-3-yloxy)-benzene-1,2-diamine:

285 mg of 3-hydroxy pyridine and 829 mg of potassium carbonate were added to a dimethylformamide (8 ml) solution of 680 mg of 3-(2-fluoro-4-nitro-phenoxy)-pyridine, and the reaction liquid was stirred at 90°C for 2 hours. The reaction liquid was diluted with ethyl acetate, washed with water and saturated saline in order, and then dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 1/1 to ethyl acetate) to obtain a crude product. 500 mg of a developed Raney-nickel catalyst was added to an ethanol (10 ml) solution of the resulting crude product, and the reaction liquid was stirred in a hydrogen atmosphere for 2 hours. The catalyst was removed through filtration, and the solvent was evaporated away under reduced pressure to obtain the entitled compound.

(Step 4) Production of 2-pyridin-2-yl-5,6-bis(pyridin-3-yloxy)-1H-benzimidazole

0.01 ml of pyridine-2-carboxaldehyde was added to a nitrobenzene (0.3 ml) solution of 30 mg of 4,5-bis(pyridin-3-yloxy)-benzene-1,2-diamine at 120°C, and the reaction liquid was stirred at the same temperature for 2 hours. The reaction mixture was purified through reversed-phase middle-pressure liquid chromatography [ODS-AS-360-CC (by YMC), mobile phase: water-acetonitrile-0.1 % trifluoroacetic acid]. The solvent of the resulting fraction was evaporated away under reduced pressure,
and this was purified through partitioning thin-layer chromatography (Kieselgel™ 60F$_2$54, Art 5744 (by Merck), chloroform/methanol = 20/1) to obtain the entitled compound as a yellow oily substance.

0.026 ml of pyridin-2-carboxaldehyde was added to a nitrobenzene (0.5 ml) solution of 59 mg of 3-(2-methoxyphenoxy)-5-(pyridin-3-yloxy)-benzene-1,2-diamine at 120°C, and the reaction liquid was stirred for 1 hour at the same temperature. The reaction mixture was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 1/1 to ethyl acetate to chloroform/methanol = 20/1). The solvent of the resulting fraction was evaporated away under reduced pressure, and the resulting residue was purified through partitioning thin-layer chromatography (Kieselgel™ 60F254, Art 5744 (by Merck), chloroform/methanol = 20/1) to obtain the entitled compound as a pale yellow solid.

Example 68:

4-(4-Fluoro-phenoxy)-2-pyrazin-2-yl-6-(pyridin-3-yloxy)-1H-benzimidazole

18.6 mg of pyrazine-2-carboxylic acid and 57.5 mg of 1-ethyl-3-(3'-dimethylaminopropyl)-carbodiimide hydrochloride were added to a pyridine (2 ml) solution of 46.7 mg of 3-(4-fluorophenoxy)-5-(pyridin-3-yloxy)-benzene-1,2-diamine produced in the same manner as in Example 67 but using 4-fluorophenol and 3-hydroxypyridine, and the reaction liquid was stirred overnight, and then pyridine was evaporated away under reduced pressure. The residue was diluted with ethyl acetate, washed with water, and dried with
anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure to obtain a mixture of amides as a yellow oily substance. The resulting mixture of amides was dissolved in 3 ml of toluene, and 28 mg of p-toluenesulfonic acid monohydrate was added to it, and the reaction liquid was stirred overnight at 120°C. The reaction liquid was diluted with ethyl acetate, washed with aqueous saturated sodium bicarbonate, and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through partitioning thin-layer chromatography (Kieselgel™ 60F254, Art 5744 (by Merck), chloroform/methanol = 20/1) to obtain the entitled compound as a yellow solid.

Aqueous saturated sodium bicarbonate was added to the reaction liquid, and extracted with ethyl acetate. The organic layer was washed with water and saturated saline, and dried with anhydrous sodium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 7/1) to obtain the entitled compound as a yellow solid.

Aqueous saturated sodium bicarbonate was added to the reaction liquid to neutralize it, and then extracted with ethyl acetate. The organic layer was washed with saturated saline, and dried with anhydrous sodium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 1/1) to obtain the entitled compound as a yellow solid.

(Step 6) Production of 1-(2-(6-(4-fluoro-phenoxy)-2-pyridin-2-yl-3H-benzimidazol-5-yl)-piperidin-1-yl)-ethanone:

The entitled compound was obtained in the same method as in Example 196 (step 4) to (step 5) or in accordance with the method or by combining it with an ordinary method but using 5-fluoro-4-(6- methanesulfonyl-pyridin-3- loxy)-2-nitro-phenylamine obtained in Example 196 (step 3) and 2-
chlorophenol.

(Step 2) Production of 5-(2-chloro-phenoxy)-2-pyridin-2-yl-6-(6-methanesulfonyl-pyridin-3-yloxy)-1H-benzimidazole:

0.26 ml of 1 M methanol solution of aniline and pyridine-2-carboxaldehyde (1/1) was added to a methanol (1 ml) solution of 35 mg of 4-(2-chlorophenoxy)-5-(6-methanesulfonyl-pyridin-3-yloxy)-benzene-1,2-diamine obtained in (step 1), and the reaction liquid was stirred overnight at 60°C. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through reversed-phase middle-pressure liquid chromatography [ODS-AS-360-CC (by YMC), mobile phase: water-acetonitrile-0.1 % trifluoroacetic acid]. The solvent of the resulting fraction was diluted with ethyl acetate, washed with aqueous saturated sodium bicarbonate, and then dried with anhydrous sodium sulfate. The solvent was evaporated away under reduced pressure to obtain the entitled compound as a pale yellow solid.

reaction liquid was diluted with ethyl acetate, washed with water and saturated saline in order, and dried with anhydrous sodium sulfate. The solvent was evaporated away under reduced pressure to obtain a crude product. 0.1 ml of fuming nitric acid was added to a trifluoroacetic acid (2 ml) solution of the crude product, and the reaction liquid was stirred overnight at 45°C. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through partitioning thin-layer chromatography (Kieselgel™ 60F<sub>254</sub>, Art 5744 (by Merck), chloroform/methanol = 20/1) to obtain the entitled compound.

(Step 3) Production of 5-(2,6-difluoro-phenoxy)-4-fluoro-2-pyrazin-2-yl-6-(6-methanesulfonyl-pyridin-3-yloxy)-1H-benzimidazole:

8 mg of 2,6-difluorophenol and 8 mg of potassium carbonate were added to an N-methylpyrrolidinone (0.5 ml) solution of 8.6 mg of N-(2,3-difluoro-4-(6-methanesulfonyl-pyridin-3-yloxy)-6-nitro-phenyl)pyrazinecarboxamide, and the reaction liquid was stirred at 90°C for 15 minutes. 75 mg of tin(II) chloride dihydrate was added to it, and the reaction liquid was stirred overnight at 90°C. Further, 3 mg of p-toluene sulfonic acid was added to it, and the reaction liquid was stirred at 90°C for 2 hours. The deposit was taken out through filtration, and purified through reversed-phase middle-pressure liquid chromatography [ODS-AS-360-CC (by YMC), mobile phase: water-acetonitrile-0.1 % trifluoroacetic acid]. The solvent of the resulting fraction was diluted with ethyl acetate, washed with aqueous saturated sodium bicarbonate, and dried with anhydrous sodium sulfate. The solvent was evaporated away under reduced pressure to obtain the entitled compound as a brown solid.

---

(Step 1) Production of 1-(2-fluoro-4-nitro-phenyl)-3-buten-1-ol:

0.65 ml of titanium tetrachloride was added to a chloroform (12 ml) solution of 2.00 g of 4-nitro-2-fluoro-benzaldehyde produced according to the method described in US 6239152, and the reaction liquid was stirred at room temperature for 10 minutes, and then 2.4 ml of allyl-trimethyl-silane was added to it, and the reaction liquid was stirred at room temperature for 20 minutes. The reaction liquid was diluted with ethyl acetate, washed with water and saturated saline, and dried with anhydrous sodium sulfate. The solvent was evaporated away under reduced pressure, and the residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 3/1) to obtain the entitled compound as an orange solid.

(Step 2) Production of N-(1-(2-fluoro-4-nitro-phenyl)-3-butenyl)-acetamide:

0.29 ml of methanesulfonyl chloride and 0.63 ml of triethylamine were added to a chloroform (10 ml) solution of 480 mg of 1-(2-fluoro-4-nitro-phenyl)-3-buten-1-ol, and the reaction liquid was stirred at room temperature for 15 minutes. The reaction liquid was washed with water, and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure to obtain a crude product as a pale yellow oily substance. 310 mg of sodium azide was added to a dimethylformamide (10 ml) solution of the crude product, and the reaction liquid was stirred at 45°C for 30 minutes. The reaction liquid was diluted with ethyl acetate, washed with water, and dried with
anhydrous sodium sulfate. The solvent was evaporated away under reduced pressure to obtain a crude product as a brown oily substance. 1.0 g of triphenylphosphine and 2 ml of water were added to a tetrahydrofuran (10 ml) solution of the resulting crude product, and the reaction liquid was stirred for 12 hours with heating under reflux. 1 N hydrochloric acid was added to the reaction liquid, and the organic layer was removed. The aqueous layer was made basic with an aqueous 1 N sodium hydroxide solution added thereto. This was extracted with chloroform, and dried with anhydrous sodium sulfate, and the solvent was evaporated away under reduced pressure to obtain 380 mg of a crude product as a brown oily substance. 0.50 ml of triethylamine, 0.25 ml of acetic anhydride and 20 mg of 4-dimethylaminopyridine were added to a chloroform (10 ml) solution of 380 mg of the crude product, and the reaction liquid was stirred at room temperature for 30 minutes. The solvent was evaporated away under reduced pressure, and the residue was purified through silica gel column chromatography (developing solvent: chloroform/methanol = 50/1) to obtain the entitled compound as a brown oily substance.

(Step 3) Production of 1-acetyl-2-(2-fluoro-4-nitro-phenyl)-4-hydroxy-pyrrolidine:

1 ml of water and 600 mg of iodine were added to a tetrahydrofuran (4 ml) solution of 200 mg of N-(1-(2-fluoro-4-nitro-phenyl)-3-butenyl)-acetamide, and the reaction liquid was stirred overnight at room temperature. The reaction liquid was diluted with chloroform, washed with aqueous saturated sodium bicarbonate, aqueous saturated sodium thiosulfate and saturated saline in order, and dried with anhydrous sodium sulfate. The solvent was evaporated away under reduced pressure to obtain a crude product. 0.25 ml of triethylamine, 0.13 ml of acetic anhydride and 10 mg of 4-dimethylaminopyridine were added to a chloroform (5 ml) solution of the crude product, and the reaction liquid was stirred at room temperature for 15 minutes. The solvent was evaporated away under reduced pressure, 20 mg of potassium carbonate was added to a methanol (5 ml) solution of the resulting residue, and the reaction liquid was stirred at room temperature for 15 minutes. The solvent was evaporated away under reduced pressure, and the residue was purified through silica gel column chromatography (developing solvent: chloroform/methanol = 30/1) to obtain the entitled compound as a colorless solid diastereomer mixture.

(Step 4) Production of 1-acetyl-2-(2-fluoro-4-((pyridin-2-carbonyl)-amino)-phenyl)-4-acetoxy-pyrrolidine:

0.06 ml of acetic anhydride was added to a pyridine (2 ml) solution of 140 mg of 1-acetyl-2-(2-fluoro-4-nitro-phenyl)-4-hydroxy-pyrrolidine, and the reaction liquid was stirred overnight at 50°C. The solvent was evaporated away under reduced pressure, and the residue was purified through silica gel column chromatography (developing solvent: ethyl acetate) to obtain 150 mg of a product. About 50 mg of developed Raney™ nickel catalyst was added to a methanol (3 ml) solution of 57 mg of the product, and the reaction liquid was stirred in a hydrogen atmosphere for 30 minutes. Then, the catalyst was removed through filtration, and the solvent was evaporated away under reduced pressure. 30 mg of pyridine-2-carboxylic acid and 50 mg of 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide monohydrochloride were added to a pyridine (2 ml) solution of the residue, and the reaction liquid was stirred overnight at room
temperature. The reaction liquid was diluted with ethyl acetate, washed with aqueous saturated sodium bicarbonate and saturated saline, and dried with anhydrous sodium sulfate. The solvent was evaporated away under reduced pressure to obtain the entitled compound as a yellow oily substance.

(Step 5) Production of trans-1-acetyl-2-(5-nitro-2-fluoro-4-((pyridin-2-carbonyl)-amino)-phenyl)-4-acetoxy-pyrrolidine and cis-1-acetyl-2-(5-nitro-2-fluoro-4-((pyridin-2-carbonyl)-amino)-phenyl)-4-acetoxy-pyrrolidine:

0.1 ml of fuming nitric acid was added to a trifluoroacetic acid (0.5 ml) solution of 36 mg of 1-acetyl-2-(2-fluoro-4-((pyridin-2-carbonyl)-amino)-phenyl)-4-acetoxy-pyrrolidine, and the reaction liquid was stirred at room temperature for 1 hour. The solvent was evaporated away under reduced pressure, and the residue was purified through silica gel column chromatography (developing solvent: chloroform/methanol = 15/1) to obtain 30 mg of a diastereomer mixture of the entitled compound as a white solid. The resulting diastereomer mixture was purified through partitioning thin-layer chromatography (Kieselgel® 60F254, Art 5744 by Merck), chloroform/methanol = 15/1) to separate the mixture into the individual diastereomers of the entitled compounds, each as a yellow solid (Rf value: trans form > cis form.)

(Step 6) Production of trans-1-(4-acetoxy-2-(6-(4-methanesulfonyl-phenoxy)-2-pyridin-2-yl-3H-benzimidazol-5-yl)-pyrrolidin-1-yl)-ethanone:

and the solvent was evaporated away under reduced pressure. Water was added to the residue, and the
precipitated deposit was taken out through filtration to obtain the entitled compound.

(Step 2) Production of 5-(2,5-difluoro-phenoxy)-2-pyrazin-2-yl-6-(6-methanesulfonyl-pyridin-3-yl)oxy)-
1H-benzimidazole:

15 mg of 2,5-difluoro-phenol and 28 mg of cesium carbonate were added to an N-
methylpyrrolidinone (0.5 ml) solution of 26 mg of pyrazine-2-carboxylic acid (5-fluoro-4-(6-
methanesulfonyl-pyridin-3-yl)oxy)-2-nitro-phenyl) amide obtained in (step 1), and the reaction liquid was
stirred at 90°C for 15 minutes, and 100 mg of tin(II) chloride dihydrate was added to the reaction liquid.
The reaction liquid was stirred at 90°C for 1 hour, and ethyl acetate and aqueous saturated sodium bicarbonate were added to it. The deposit was removed through filtration, the solvent was evaporated away under reduced pressure, and the residue was purified through reversed-phase middle-pressure liquid chromatography [ODS-AS-360-CC (by YMC), mobile phase: water-acetonitrile-0.1 % trifluoroacetic acid]. The solvent of the resulting fraction was diluted with ethyl acetate, washed with aqueous saturated sodium bicarbonate, and dried with anhydrous sodium sulfate. The solvent was evaporated away under
reduced pressure to obtain the entitled compound as a pale yellow solid.

100 ml of 4 N hydrochloric acid-dioxane solution was added to a solution of 19 g of t-butyl 2-(4-amino-2-fluoro-phenyl)-pyrrolidine-1-carboxylate obtained in Example 338 (step 2) in a mixture of 50 ml of ethyl acetate and 50 ml of methanol, with cooling with ice, and the reaction liquid was stirred overnight at room temperature. The solvent was evaporated away under reduced pressure to obtain the entitiled compound as a white solid.

(Step 2) Production of 2,2,2-trifluoro-N-(3-fluoro-4-(1-(trifluoroacetyl)pyrrolidin-2-yl)phenyl)acetamide:

39 ml of pyridine and 24 ml of trifluoroacetic acid anhydride were added in order to a chloroform (200 ml) solution of 20 g of (3-fluoro-4-pyrrolidin-2-ylphenyl)amine dihydrochloride with cooling with ice, and the reaction liquid was stirred at room temperature for 30 minutes. The reaction liquid was diluted with ethyl acetate, washed with water and saturated saline in order, and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure to obtain the
entitled compound as a brown oily substance.

(Step 3) Production of 2,2,2-trifluoro-N-(3-fluoro-4-(1-(trifluoroacetyl)pyrrolidin-2-yl)phenyl)acetamide:

100 ml of fuming nitric acid was added to 28 g of 2,2,2-trifluoro-N-(3-fluoro-4-(1-(trifluoroacetyl)pyrrolidin-2-yl)phenyl)acetamide with cooling with ice, and the reaction liquid was stirred at room temperature for 1 hour. Water with ice was added to the reaction liquid to dilute it, then extracted with ethyl acetate, washed with saturated saline, and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 10/1) to obtain the entitled compound as a yellow oily substance.

(Step 4) Production of t-butyl 2-(4-amino-2-fluoro-5-nitrophenyl)pyrrolidin-1-yl carboxylate:

150 ml of aqueous 1 N sodium hydroxide solution was added to a tetrahydrofuran (150 ml) solution of 29 g of 2,2,2-trifluoro-N-(5-fluoro-2-nitro-4-(1-(trifluoroacetyl)pyrrolidin-2-yl)phenyl)acetamide with cooling with ice, and the reaction liquid was stirred at room temperature for 5 hours. 23 ml of di-t-butyl dicarbonate was added to the reaction liquid, and the reaction liquid was stirred for 30 minutes. The reaction liquid was diluted with ethyl acetate, washed with water and saturated saline in order, and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 5/1) to obtain the entitled compound as a yellow solid.

(Step 5) Production of t-butyl 2-(4-amino-2-((2'-fluorobiphenyl-4-yl)oxy)-5-nitrophenyl)pyrrolidine-1-carboxylate:

200 mg of 2'-fluorobiphenyl-4-ol and 184 mg of potassium carbonate were added to an N,N-dimethylformamide (3 ml) solution of 288 mg of t-butyl 2-(4-amino-2-fluoro-5-nitrophenyl)pyrrolidine-1-carboxylate, and the reaction liquid was stirred overnight at 80°C. The reaction liquid was diluted with ethyl acetate, washed with water and saturated saline in order, and dried with anhydrous magnesium sulfate. The solvent was evaporated away, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 5/1) to obtain the entitled compound as a yellow solid.

(Step 6) Production of t-butyl 2-(4,5-diamino-2-((2'-fluorobiphenyl-4-yl)oxy)phenyl)pyrrolidine-1-carboxylate:

1 ml of developed Raney nickel was added to a methanol (5 ml) solution of 410 mg of t-butyl 2-(4-amino-2-((2'-fluorobiphenyl-4-yl)oxy)-5-nitrophenyl)pyrrolidine-1-carboxylate, and the reaction liquid was stirred in a hydrogen atmosphere at room temperature for 1 day. The catalyst was removed through filtration through Celite, and the solvent was evaporated away under reduced pressure, and the residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 1/1) to obtain the entitled compound as a brown oily substance.
(Step 7) Production of 5-(((2'-fluorobiphenyl-4-yl)oxy)-2-pyridin-2-yl-6-pyrroolidin-2-yl-1H-benzimidazole:

1.6 ml of N-((1E)-pyridin-2-ylmethylene)aniline (1 M methanol solution) was added to a methanol (5 ml) solution of 255 mg of t-butyl 2-(4,5-diamo-2-(((2'-fluorobiphenyl-4-yl)oxy)phenyl)pyrrolidine-1-carboxylate, and the reaction liquid was stirred at 90°C for 1 day. The reaction liquid was diluted with ethyl acetate, washed with water and saturated saline in order, and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure, and 5 ml of 4 N hydrochloric acid-dioxane solution was added to 332 mg of the resulting residue, and the reaction liquid was stirred at room temperature for 3 hours. The solvent was evaporated away under reduced pressure, diluted with aqueous saturated sodium bicarbonate, and extracted with chloroform. The organic layer was washed with aqueous saturated saline, and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: chloroform/methanol/aqueous ammonia = 20/1/0.1) to obtain the entitled compound as a pale yellow substance.

(Step 8) Production of (2-(2-(5-(((2'-fluorobiphenyl-4-yl)oxy)-2-pyridin-2-yl-1H-benzimidazol-6-yl)pyrroolidin-1-yl)-2-oxoethyl)methylamine:

19 mg of N-(t-butoxycarbonyl)-N-methylglycine and 24 mg of 1-(3-dimethylaminopropyl)-3-ethylcarbodiimide monohydrochloride were added in order to a pyridin (1 ml) solution of 37 mg of 5-(((2'-fluorobiphenyl-4-yl)oxy)-2-pyridin-2-yl-6-pyrroolidin-2-yl-1H-benzimidazole, and the reaction liquid was stirred at room temperature for 3 hours. 2 ml of 4 N hydrochloric acid-dioxane solution was added to the reaction liquid, and the reaction liquid was stirred at room temperature for 1 hour. The reaction liquid was diluted with chloroform, and made basic with aqueous saturated sodium carbonate added thereto, and the organic layer was washed with saturated saline and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: chloroform/methanol = 10/1) to obtain the entitled compound as a pale yellow solid.

5.79 g of N-methoxy-N-methylamine hydrochloride and 12.4 g of 1-ethyl-3-(3'-dimethylaminopropyl)-carbodiimide hydrochloride were added to a pyridine (80 ml) suspension of 10 g of 2-fluoro-4-nitrobenzoic acid, and the reaction liquid was stirred overnight at room temperature. Pyridine was evaporated away under reduced pressure, and water was added to it. The resulting deposit was taken out through filtration, washed with water, and dried to obtain the entitled compound as a pale yellow solid.

The reaction liquid was filtered through Celite, and the solvent was evaporated away under reduced pressure. The resulting residue was diluted with ethyl acetate, washed with water, and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 9/1 to 1/2 to obtain the entitled compound as a brown oily substance.

A tetrahydrofuran (60 ml) solution of 2.7 g of N-(3-fluoro-4-((N-methoxy-N-methylamino)carbonyl)phenyl)pyrazine-2-carboxamide was added to it at -78°C, and the reaction liquid was heated up to room temperature and stirred for 2 hours. Water was added to the reaction liquid, extracted with ethyl acetate, and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 9/1 to 1/1) to obtain the entitled compound as a yellow solid.

(Step 5) Production of N-(4-((4R)-4-((tert-butyl(dimethyl)silyl)oxy)-pentanoyl)-3-fluorophenyl)pyrazine-2-carboxamide:

100 mg of 10 % palladium-carbon catalyst was added to a solution of 513 mg of N-(4-((4R)-4-((tert-butyl(dimethyl)silyl)oxy)-2-pentynoyl)-3-fluorophenyl)pyrazine-2-carboxamide in 5 ml of tetrahydrofuran and 20 ml of ethanol, and the reaction liquid was stirred in a hydrogen atmosphere for 1.5 hours. The catalyst was removed through filtration, the solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate = 9/1 to 1/1) to obtain the entitled compound as a pale yellow solid.

(Step 6) Production of N-(4-((4R)-1,4-dihydropropentyl)-3-fluorophenyl)pyrazine-2-carboxamide:

89 mg of sodium borohydride was added to a solution of 340 mg of N-(4-((4R)-4-((tert-butyl(dimethyl)silyl)oxy)-pentanoyl)-3-fluorophenyl)pyrazine-2-carboxamide in a mixture of 10 ml of methanol and 5 ml of tetrahydrofuran, and the reaction liquid was stirred at room temperature for 30 minutes. The reaction liquid was distilled under reduced pressure, and the residue was diluted with ethyl acetate, washed with aqueous saturated ammonium chloride, and dried with anhydrous magnesium sulfate. The solvent was evaporated away under reduced pressure to obtain a crude product. 1.18 ml of tetrabutylammonium fluoride (1 M tetrahydrofuran solution) was added to a tetrahydrofuran (6 ml) solution of the resulting crude product with cooling with ice, and the reaction liquid was stirred at room temperature for 2 hours. The solvent was evaporated away under reduced pressure, and the resulting residue was purified through silica gel column chromatography (developing solvent: hexane/ethyl acetate
