UNITED STATES PATENT OFFICE.

STEPHEN WELDON, OF PHILADELPHIA, PENNSYLVANIA.

JUVENILE-ROCKER.

SPECIFICATION forming part of Letters Patent No. 281,420, dated July 17, 1883.

Application filed January 15, 1883. (No model.)

To all whom it may concern:

Be it known that I, STEPHEN WELDON, a citizen of the United States, residing at Philadelphia, in the county of Philadelphia and State of Pennsylvania, have invented a new and useful Improvement in Juvenile-Rockers, of which the following is a specification.

My invention consists of side rockers or frames connected by a seat, in combination with a sliding box.

I am aware that Letters Patent have been granted for juvenile-rockers in which the features of my invention are illustrated and described, with this difference, that in those patents the box or toy-holder is either fixed or vibratory on a pivot or center. In my invention the box slides on or in guides, so as to be adjustable and detachable.

Figure 1 is a perspective elevation. Fig. 2 is an enlarged perspective elevation, one side being removed for the purpose of making the invention more obvious; and Fig. 3 is a perspective bottom view of the sliding box and its holding latch or bolt.

A are the rockers or sides, and B the seat. C is a toy-box placed in front of the seat and between the sides. For facility of adjustment and removal, the box is arranged to slide over or in suitable guides, *a*, which can extend from the sides A into the box, or from the box into the sides. To retain the box at any relative position, it has a fit bolt or latch, D, which engages with either side.

I claim as my invention—

1. The sides A, in combination with a sliding box, C, and guides *a*, for the purpose shown and described.

2. The sides A, in combination with a sliding box, C, guides *a*, and a latch, D, for the purpose shown and described.

STEPHEN WELDON.
