Title: ANTI-ADRENOMEDULLIN (ADM) ANTIBODY OR ANTI-ADM ANTIBODY FRAGMENT OR ANTI-ADM NON-IG SCAFFOLD FOR PREVENTION OR REDUCTION OF ORGAN DYSFUNCTION OR ORGAN FAILURE IN A PATIENT HAVING A CHRONIC OR ACUTE DISEASE OR ACUTE CONDITION

Abstract: Subject matter of the present disclosure is an anti-adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or an anti-ADM non-IG scaffold for use in therapy of a chronic or acute disease or acute condition of a patient for prevention or reduction of organ dysfunction or organ failure. In a preferred embodiment subject matter of the disclosure is an anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-IG scaffold for use in therapy of a chronic or acute disease or acute condition of a patient for prevention or reduction of kidney dysfunction or kidney failure or liver dysfunction or liver failure.
Anti-adrenomedullin (ADM) antibody or anti-ADM antibody fragment or anti-ADM non-Ig scaffold for prevention or reduction of organ dysfunction or organ failure in a patient having a chronic or acute disease or acute condition

Field of the invention

Subject matter of the present invention is an anti-adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or an anti-ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition of a patient for prevention or reduction of organ dysfunction or organ failure.

In a preferred embodiment subject matter of the invention is an anti-ADM antibody or an anti-adrenomedullin antibody fragment or an anti-ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition of a patient for prevention or reduction of kidney dysfunction or kidney failure or for prevention or reduction of liver dysfunction or liver failure.

Background

The peptide adrenomedullin (ADM) was described for the first time in 1993 (Kitamura, K., et al., "Adrenomedullin: A Novel Hypotensive Peptide Isolated From Human Pheochromocytoma", Biochemical and Biophysical Research Communications, Vol. 192 (2), pp. 553-560 (1993)) as a novel hypotensive peptide comprising 52 amino acids, which had been isolated from a human pheochromocytome; SEQ ID No.: 21. In the same year, cDNA coding for a precursor peptide comprising 185 amino acids and the complete amino acid sequence of this precursor peptide were also described. The precursor peptide, which comprises, inter alia, a signal sequence of 21 amino acids at the N-terminus, is referred to as "preroadrenomedullin" (pre-proADM). In the present description, all amino acid positions specified usually relate to the pre-proADM which comprises the 185 amino acids. The peptide adrenomedullin (ADM) is a peptide which comprises 52 amino acids (SEQ ID NO: 21) and which comprises the amino acids 95 to 146 of pre-proADM, from which it is formed by proteolytic cleavage. To date, substantially only a few fragments of the peptide fragments formed in the cleavage of the pre-proADM have been more exactly characterized, in particular the physiologically active peptides adrenomedullin (ADM) and "PAMP", a peptide comprising 20 amino acids (22-41) which follows the 21 amino acids of the signal peptide in
pre-proADM. The discovery and characterization of ADM in 1993 triggered intensive research activity, the results of which have been summarized in various review articles, in the context of the present description, reference being made in particular to the articles to be found in an issue of "Peptides" devoted to ADM in particular (Editorial, Takahashi, K., "Adrenomedullin: from a pheochromocytoma to the eyes", Peptides, Vol. 22, p. 1691 (2001)) and (Eto, T., "A review of the biological properties and clinical implications of adrenomedullin and proadrenomedullin N-terminal 20 peptide (PAMP), hypotensive and vasodilating peptides", Peptides, Vol. 22, pp. 1693-1711 (2001)). A further review is (Hinson, et al., "Adrenomedullin, a Multifunctional Regulatory Peptide", Endocrine Reviews, Vol. 21(2), pp. 138-167 (2000)). In the scientific investigations to date, it has been found, inter alia, that ADM may be regarded as a polyfunctional regulatory peptide. It is released into the circulation in an inactive form extended by glycine (Kitamura, K., et al., "The intermediate form of glycine-extended adrenomedullin is the major circulating molecular form in human plasma", Biochem. Biophys. Res. Commun., Vol. 244(2), pp. 551-555 (1998). Abstract Only). There is also a binding protein (Pio, R., et al., "Complement Factor H is a Serum-binding Protein for adrenomedullin, and the Resulting Complex Modulates the Bioactivities of Both Partners", The Journal of Biological Chemistry, Vol. 276(15), pp. 12292-12300 (2001)) which is specific for ADM and probably likewise modulates the effect of ADM. Those physiological effects of ADM as well as of PAMP which are of primary importance in the investigations to date were the effects influencing blood pressure.

Hence, ADM is an effective vasodilator, and thus it is possible to associate the hypotensive effect with the particular peptide segments in the C-terminal part of ADM. It has furthermore been found that the abovementioned further physiologically active peptide PAMP formed from pre-proADM likewise exhibits a hypotensive effect, even if it appears to have an action mechanism differing from that of ADM (cf. in addition to the abovementioned review articles (Eto, T., "A review of the biological properties and clinical implications of adrenomedullin and proadrenomedullin N-terminal 20 peptide (PAMP), hypotensive and vasodilating peptides", Peptides, Vol. 22, pp. 1693-1711 (2001)) and (Hinson, et al., "Adrenomedullin, a Multifunctional Regulatory Peptide", Endocrine Reviews, Vol. 21(2), pp. 138-167 (2000)) also (Kuwasa, K., et al., "Purification and characterization of PAMP-12 (PAMP-20) in porcine adrenal medulla as a major endogenous biologically active peptide", FEBS Lett, Vol. 414(1), pp. 105-110 (1997). Abstract only), (Kuwasaki, K., et al., "Increased plasma proadrenomedullin N-terminal 20 peptide in patients with essential hypertension", Ann. Clin.

Known in the art is further a method for identifying adrenomedullin immunoreactivity in biological liquids for diagnostic purposes and, in particular within the scope of sepsis diagnosis, cardiac diagnosis and cancer diagnosis. According to the invention, the midregional partial peptide of the proadrenomedullin, which contains amino acids (45-92) of the entire preproadrenomedullin, is measured, in particular, with an immunoassay which
works with at least one labeled antibody that specifically recognizes a sequence of the mid-proADM. (WO2004/090546).

WO-A1 2004/097423 describes the use of an antibody against adrenomedullin for diagnosis, prognosis, and treatment of cardiovascular disorders. Treatment of diseases by blocking the ADM receptor are also described in the art, (e.g. WO-A1 2006/027147, PCT/EP2005/012844) said diseases may be sepsis, septic shock, cardiovascular diseases, infections, dermatological diseases, endocrinological diseases, metabolic diseases, gastroenterological diseases, cancer, inflammation, hematological diseases, respiratory diseases, muscle skeleton diseases, neurological diseases, urological diseases.

It is reported for the early phase of sepsis that ADM improves heart function and the blood supply in liver, spleen, kidney and small intestine. ADM-neutralizing antibodies neutralize the before mentioned effects during the early phase of sepsis (Wang, P., "Adrenomedullin and cardiovascular responses in sepsis", Peptides, Vol. 22, pp. 1835-1840 (2001).

In the later phase of sepsis, the hypodynamical phase of sepsis, ADM constitutes a risk factor that is strongly associated with the mortality of patients in septic shock. (Schütz et al., “Circulating Precursor levels of endothelin-1 and adrenomedullin, two endothelium-derived, counteracting substances, in sepsis”, Endothelium, 14:345-351, (2007)). Methods for the diagnosis and treatment of critically ill patients, e.g. in the very late phase of sepsis, and the use of endothelin and endothelin agonists with vasoconstrictor activity for the preparation of medicaments for the treatment of critically ill patients have been described in WO-AI 2007/062676. It is further described in WO-AI 2007/062676 to use, in place of endothelin and/or endothelin agonists, or in combination therewith, adrenomedullin antagonists, i.e. molecules which prevent or attenuate the vasodilating action of adrenomedulin, e.g. by blocking its relevant receptors, or substances preventing the binding of adrenomedullin to its receptor (e.g. specific binders as e.g. antibodies binding to adrenomedullin and blocking its receptor bindings sites; "immunological neutralization"). Such use, or combined use, including a subsequent or preceding separate use, has been described in certain cases to be desirable for example to improve the therapeutic success, or to avoid undesirable physiological stress or side effects. Thus, it is reported that neutralizing ADM antibodies may be used for the treatment of sepsis in the late stage of sepsis.
Administration of ADM in combination with ADM-binding-Protein-1 is described for treatment of sepsis and septic shock in the art. It is assumed that treatment of septic animals with ADM and ADM-binding-Protein-1 prevents transition to the late phase of sepsis. It has to be noted that in a living organism ADM binding protein (complement factor H) is present in the circulation of said organism in high concentrations (Pio et al.: Identification, characterization, and physiological actions of complement factor H as an Adrenomedullin binding Protein present in Human Plasma; Microscopy Res. and Technique, 55:23-27 (2002) and Martinez et al.: Mapping of the Adrenomedullin-Binding domains in Human Complement factor H; Hypertens Res Vol. 26, Suppl (2003), S56-59).

In accordance with the invention the ADM-binding-Protein-1 may be also referred to as ADM-binding-Protein-1 (complement factor H).

Prevention or reduction of organ dysfunction or organ failure is very important when treating a patient having a chronic or acute disease or acute condition, especially a life threatening disease or condition.

Description of the invention

Subject matter of the present invention is an anti-adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition of a patient for prevention or reduction of organ dysfunction or organ failure. In a preferred embodiment subject matter of the invention is an anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition of a patient for prevention or reduction of kidney dysfunction or kidney failure or liver dysfunction or liver failure. Said organ may be selected from the group comprising heart, kidney, liver, lungs, pancreas, small intestines and spleen. Anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold may be administered at any point of time before the occurrence of dysfunction or failure or after the occurrence of dysfunction or failure.

“Organ dysfunction” denotes a condition or a state of health where an organ does not perform its expected function. “Organ failure” denotes an organ dysfunction to such a degree that normal homeostasis cannot be maintained without external clinical intervention.
By contrast, organ function represents the expected function of the respective organ within physiologic ranges. The person skilled in the art is aware of the respective function of an organ during medical examination. Therefore, in the following only basic information in regard to particular organs within the scope of the invention is provided:

5 The heart is a chambered muscular organ that pumps blood received from the veins into the arteries. Thereby the heart is maintaining the flow of blood through the circulatory system entirely to supply oxygen to the body.

The kidneys are a pair of organs that function to maintain adequate water and electrolyte balance, they regulate acid-base concentration, and further filter the blood of metabolic wastes, which are afterwards excreted as urine.

10 The liver is a large organ that secretes bile and is active in the formation of certain blood proteins and in the metabolism of carbohydrates, fats, and proteins.

The lungs are functioning to remove carbon dioxide from the blood and provide it with oxygen.

15 The pancreas secretes pancreatic juice into the duodenum and insulin, glucagon, and somatostatin into the bloodstream.

The small intestines are the part of the digestive tract, in which the process of digestion is practically completed. It is narrow and contorted, and consists of three parts, the duodenum, jejunum, and ileum.

20 The spleen plays important roles in regard to erythrocytes – the red blood cells – and the immune system. Specifically, the spleen removes old red blood cells and holds a reserve of blood in case of hemorrhagic shock while also recycling iron. Further, it metabolizes hemoglobin removed from senescent erythrocytes. The globin portion of hemoglobin is degraded to its constituent amino acids, and the heme portion is metabolized to bilirubin, which is subsequently shuttled to the liver for its removal. In addition, the spleen synthesizes antibodies in its white pulp and removes antibody-coated bacteria along with antibody-coated blood cells by way of blood and lymph node circulation.

It should be emphasized that the provided anti-adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold are intended by the present
invention to be applied for sake of prevention or reduction of organ dysfunction and organ failure, and thus are not necessarily intended for any methods of primary treatment or first line treatment to the chronic or acute disease or acute condition itself, which therefore can be termed as underlying disease(s). This means the present invention does not provide for a therapy of healing/curing e.g. infections, cancer, or tumors located in the respective organ, but for resuscitating the respective organ towards physiologic function. Accordingly, the therapy for a chronic or acute disease or acute condition of a patient within the scope of the invention is related to any kind of organ insufficiency, or poor organ function as an acute event.

Specifically according to the invention it has to be understood that in case of any organ dysfunction or organ failure of pancreas that is e.g. due to diabetes mellitus, the herein provided anti-ADM antibody, anti-ADM antibody fragment, or anti-ADM non-Ig scaffold are not intended for first line treatment of diabetes, but for resuscitating pancreas' physiologic function.

Specifically according to the invention it has to be understood that in case of any organ dysfunction or organ failure of e.g. pancreas, lung, liver, kidney, spleen, small intestine, heart that is due to cancerous tumors or cancer, the herein provided anti-ADM antibody, anti-ADM antibody fragment, or anti-ADM non-Ig scaffold are not intended for first line treatment of cancerous tumors or cancer in the respective organ, but for resuscitating the respective organ's physiologic function.

The patient group(s) addressed by the instant invention can be defined as set out below.

In the following, clinical criteria are mentioned for respective organs that are prone to dysfunction or failure, and thus represent the patient group(s) of having a chronic or acute disease or acute condition in accordance with the invention:

The criteria orientate on the clinical SOFA score.

The SOFA system was created in a consensus meeting of the European Society of Intensive Care Medicine in 1994 and further revised in 1996.

The SOFA is a six-organ dysfunction/failure score measuring multiple organ failure daily. Each organ is graded from 0 (normal) to 4 (the most abnormal), providing a daily score of 0 to 24 points. The objective of the SOFA is to create a simple, reliable, and continuous score for clinical staff.
Sequential assessment of organ dysfunction during the first few days of intensive care unit (ICU) or hospital admission is a good indicator of prognosis. Both the mean and highest SOFA scores are particularly useful predictors of outcome.

References for SOFA score

In a specific embodiment the patient group pursuant to the invention is having as lower threshold at least one SOFA score, being it 1 for one the clinical criteria respiration, or liver, or coagulation, or cardiovascular, or CNS, or renal on day of admission to hospital or Intensive Care Unit (ICU). Thus, said patient group is in need of therapeutic intervention pursuant to the invention, and thus in need for prevention or reduction of organ dysfunction or organ failure.

In another specific embodiment the patient group pursuant to the invention is having as lower threshold at least two SOFA scores, being it 1 each for the clinical criteria respiration, and/or liver, and/or coagulation, and/or cardiovascular, and/or CNS, and/or renal on day of admission to hospital or Intensive Care Unit (ICU). Thus, said patient group is in need of therapeutic intervention pursuant to the invention, and thus in need for prevention or reduction of organ dysfunction or organ failure.

In another specific embodiment the patient group pursuant to the invention is having as lower threshold at least three SOFA scores, being it 1 each for the clinical criteria respiration, and/or liver, and/or coagulation, and/or cardiovascular, and/or CNS, and/or renal on day of admission to hospital or Intensive Care Unit (ICU). Thus, said patient group is in need of therapeutic intervention pursuant to the invention, and thus in need for prevention or reduction of organ dysfunction or organ failure.
In another specific embodiment the patient group pursuant to the invention is having as lower threshold at least four SOFA scores, being it 1 each for the clinical criteria respiration, and/or liver, and/or coagulation, and/or cardiovascular, and/or CNS, and/or renal on day of admission to hospital or Intensive Care Unit (ICU). Thus, said patient group is in need of therapeutic intervention pursuant to the invention, and thus in need for prevention or reduction of organ dysfunction or organ failure.

In another specific embodiment the patient group in need for prevention or reduction of renal organ dysfunction or renal organ failure pursuant to the invention is having a renal SOFA score of at least 1, or of 2, or of 3, or of 4.

In another specific embodiment the patient group in need for prevention or reduction of liver organ dysfunction or liver organ failure pursuant to the invention is having a liver SOFA score of at least 1, or of 2, or of 3, or of 4.

In another specific embodiment the patient group in need for prevention or reduction of heart organ dysfunction or heart organ failure pursuant to the invention is having a cardiovascular SOFA score of at least 1, or of 2, or of 3, or of 4.

In another specific embodiment the patient group in need for prevention or reduction of lung organ dysfunction or lung organ failure pursuant to the invention is having a respiratory SOFA score of at least 1, or of 2, or of 3, or of 4.

Independent of the initial score, generally an increase in SOFA score during the first 48 hours in the ICU or in the hospital predicts a mortality rate of at least 50%.

Thus, in another specific embodiment the patient group in need of therapeutic intervention for organ dysfunction / failure in accordance with invention is characterized by having at least one SOFA score increased within the initial 48 hours after admission to hospital or ICU.

**Patient group – kidney dysfunction / failure**

In the following, said clinical criteria denote the patient group(s) for kidney dysfunction / failure:
• Patients at risk for kidney dysfunction / failure: GFR decrease > 25%, serum creatinine increased 1.5 times or urine production of < 0.5 ml/kg/hr for 6 hours
• Patients with present kidney injury: GFR decrease > 50%, doubling of creatinine or urine production < 0.5 ml/kg/hr for 12 hours
• Patients with kidney failure: GFR decrease > 75%, tripling of creatinine or creatinine > 355 μmol/l (with a rise of > 44) (> 4 mg/dl) or urine output below 0.3 ml/kg/hr for 24 hours
• Patients with loss of kidney function: persistent acute kidney injury (AKI) or complete loss of kidney function for more than 4 weeks
• End-stage renal disease: complete loss of kidney function for more than 3 months.

Patient group – liver dysfunction / failure

The patient group for liver dysfunction / failure is characterized by a lower threshold of Bilirubin of > 1.2 mg/dL, preferably > 1.9 mg/dL, more preferably > 5.9 mg/dL.

Oxygen depletion

The person skilled in the art is aware that sepsis is associated with mitochondrial dysfunction, which inevitably leads to impaired oxygen consumption and ultimately to sepsis-induced multiple organ failure.

This holds especially true for raised tissue oxygen tensions in septic patients, suggesting reduced ability of the organs to use oxygen. Because ATP production by mitochondrial oxidative phosphorylation accounts for more than 90% of total oxygen consumption mitochondrial dysfunction may directly results in organ failure, possibly due to nitric oxide, which is known to inhibit mitochondrial respiration in vitro and is produced in excess in sepsis.

Therefore, in a very specific embodiment of the invention the anti-ADM antibody or the anti-ADM antibody fragment or anti-ADM non-Ig scaffold are particularly intended to be used in methods of prevention for organ dysfunction and failure in SIRS, sepsis, severe sepsis, shock and septic shock patients.

Oxygene depletion may be also caused by ischemic events as e.g. by pass surgery.
The anti-ADM antibody or the anti-ADM antibody fragment or anti-ADM non-Ig scaffold may be also administered preventively before the patient exhibits any signs of dysfunction or failure of an organ. This might be the case if the patient has a chronic or acute disease or acute condition where dysfunction or failure problems may be expected, e.g. comprising severe infections as e.g. meningitis, Systemic inflammatory Response-Syndrome (SIRS,) sepsis; other diseases as diabetes, cancer, acute and chronic vascular diseases as e.g. heart failure, myocardial infarction, stroke, atherosclerosis; shock as e.g. septic shock and organ dysfunction as e.g. kidney dysfunction, liver dysfunction, burnings, surgery, traumata, poisoning. The anti-ADM antibody or the anti-ADM antibody fragment or anti-ADM non-Ig scaffold may be also administered preventively or therapeutically before, or during or after chemotherapy. The same applies for surgeries where ischemic damages may occur to certain organs which may result in dysfunction or failure of an organ. Preventively means before an organ damage occurs and therapeutically means that an organ damage has been already occurred. Especially useful is the antibody or fragment or scaffold according to the present invention for reducing the risk of organ dysfunction or failure during sepsis and septic shock, i.e. late phases of sepsis.

Acute disease or acute conditions may be selected from the group but are not limited to the group comprising severe infections as e.g. meningitis, Systemic inflammatory Response-Syndrom (SIRS), or sepsis; other diseases as diabetes, cancer, acute and chronic vascular diseases as e.g. heart failure, myocardial infarction, stroke, atherosclerosis; shock as e.g. septic shock and organ dysfunction as e.g. kidney dysfunction, liver dysfunction, burnings, surgery, traumata, poisoning, damages induced by chemotherapy. Especially useful is the antibody or fragment or scaffold according to the present invention for reducing the risk of mortality during sepsis and septic shock, i.e. late phases of sepsis.

In the following clinical criteria for SIRS, sepsis, severe sepsis, septic shock will be defined.

1) Systemic inflammatory host response (SIRS) characterized by at least two of the following symptoms

- patients exhibit hypotension (mean arterial pressure is < 65 mm Hg)
- elevated serum lactate level being > 4 mmol/L
- blood glucose > 7.7 mmol/L (in absence of diabetes)
- central venous pressure is not within the range 8–12 mm Hg
- urine output is < 0.5 mL x kg⁻¹ x hr⁻¹
- central venous (superior vena cava) oxygen saturation is < 70% or mixed venous < 65%
- heart rate is > 90 beats/min
- temperature < 36°C or > 38°C
- respiratory rate > 20/min
- white cell count < 4 or > 12x10⁹/L (leucocytes); > 10% immature neutrophils

2) Sepsis

Following at least two of the symptoms mentioned under 1), and additionally a clinical suspicion of new infection, being:

- cough/sputum/chest pain
- abdominal pain/distension/diarrhoea
- line infection
- endocarditis
- dysuria
- headache with neck stiffness
- cellulitis/wound/joint infection
- positive microbiology for any infection

3) Severe sepsis

Provided that sepsis is manifested in patient, and additionally a clinical suspicion of any organ dysfunction, being:

- blood pressure systolic < 90/mean; <65mmHg
- lactate > 2 mmol/L
- Bilirubine > 34μmol/L
• urine output < 0.5 mL/kg/h for 2h
• creatinine > 177 µmol/L
• platelets < 100x10⁹/L
• SpO₂ > 90% unless O₂ given

4) Septic shock

At least one sign of end-organ dysfunction as mentioned under 3) is manifested. Septic shock is indicated, if there is refractory hypotension that does not respond to treatment and intravenous systemic fluid administration alone is insufficient to maintain a patient's blood pressure from becoming hypotensive also provides for an administration of an anti-ADM antibody or an anti-ADM antibody fragment or an anti-ADM non-Ig scaffold in accordance with the present invention.

Thus, acute disease or acute conditions may be selected from the group but are not limited to the group comprising severe infections as e.g. meningitis, Systemic inflammatory Response-Syndrome (SIRS), or sepsis; other diseases as diabetes, cancer, acute and chronic vascular diseases as e.g. heart failure, myocardial infarction, stroke, atherosclerosis; shock as e.g. septic shock and organ dysfunction as e.g. kidney dysfunction, liver dysfunction, burnings, surgery, trauma, poisoning, damages induced by chemotherapy. Especially useful is the antibody or fragment or scaffold according to the present invention for reducing the risk of mortality during sepsis and septic shock, i.e. late phases of sepsis.

In one embodiment of the present invention the patient is not suffering from SIRS, a severe infection, sepsis, shock as e.g. septic shock. Said severe infection denotes e.g. meningitis, Systemic inflammatory Response-Syndrome (SIRS), sepsis, severe sepsis, and shock as e.g. septic shock. In this regard, a severe sepsis is characterized in that sepsis is manifested in said patient, and additionally a clinical suspicion of any organ dysfunction is present, being it:

• blood pressure systolic < 90/mean; < 65mmHG
• lactate > 2 mmol/L
• Bilirubine > 34µmol/L
• urine output < 0.5 mL/kg/h for 2h
- creatinine >177 μmol/L
- platelets < 100x10⁹/L
- SpO₂ > 90% unless O₂ given

In another specific embodiment said acute disease or acute condition is not sepsis, severe sepsis or is not SIRS or is not shock, or septic shock.

In another embodiment said acute disease or acute condition is not sepsis.

In another embodiment said acute disease or acute condition is selected from the group comprising meningitis, diabetes, cancer, acute and chronic vascular diseases as e.g. heart failure, myocardial infarction, stroke, atherosclerosis; shock as e.g. septic shock and organ dysfunction as e.g. kidney dysfunction, liver dysfunction, burnings, surgery, traumata, poisoning, damages induced by chemotherapy.

It should be emphasized that the herein provided anti-ADM antibody, anti-ADM antibody fragment or anti-ADM non-Ig scaffold is not intended for first line treatment of any organ associated diseases such as nephroliths, renal cancer, nephritis, liver cirrhosis, fatty liver, hepatic cancer, or e.g. hepatitis. The anti-ADM antibody or an anti-ADM antibody fragment or an anti-ADM non-Ig scaffold in accordance with the invention are intended to prevent from or address a malfunction in the respective organ’s physiologic function.

The organ protecting effect of the anti-ADM antibody or the anti-ADM antibody fragment or anti-ADM non-Ig scaffold is thus supporting the primary therapy of said chronic or acute disease or acute condition. In case of a chronic or acute disease or acute condition like a severe infection, SIRS, sepsis or the like the primary therapy would be e.g. the administration of antibiotics. The anti-ADM antibody or the anti-ADM antibody fragment or anti-ADM non-Ig scaffold would protect the organ and would help to prevent worsening of the critical condition of said patient until the e.g. antibiotic administration takes effect. As before mentioned the anti-ADM antibody or the anti-ADM antibody fragment or anti-ADM non-Ig scaffold may be administered in a preventive way or in a therapeutic way, this means in order
to prevent dysfunction or failure problems or in order to reduce organ dysfunction when dysfunction problems are present in a said patient.

In another specific embodiment of the invention the expression "the anti-ADM antibody or the anti-ADM antibody fragment or anti-ADM non-Ig scaffold may be administered in a preventive way or in a therapeutic way" denotes systemic administration to a patient.

In one embodiment of the invention an Anti-adrenomedullin (ADM) antibody or an anti-ADM antibody fragment or anti-ADM non-Ig scaffold is to be used in combination with vasopressors e.g. catecholamine wherein said combination is for use in therapy of a chronic or acute disease or acute condition of a patient for protecting an organ of said patient.

Subject matter of the invention in one specific embodiment is, thus, an anti-ADM (ADM) antibody or an anti-ADM antibody fragment or anti-ADM non-Ig scaffold for use in therapy of a patient in need of an administration of vasopressors e.g. of catecholamine administration.

Furthermore, in one embodiment of the invention an anti-adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or an anti-ADM non-Ig scaffold is to be used in combination with fluids administered intravenously, wherein said combination is for use in therapy of a patient having a chronic or acute disease or acute condition of a patient for protecting the organs of said patient. It should be emphasized that said fluids to be administered intravenously are administered systemically.

In one embodiment of the invention said patient having a chronic or acute disease or condition being in need for protecting its organs is characterized by the need of said patient to get intravenous fluids.

It should be noted that in accordance with the invention administration of fluids is in the meaning of systemic administration of fluids.

Subject matter of the invention in one specific embodiment is, thus, an anti-adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold for use in therapy of a patient in need of intravenous fluids. Even with restoration of adequate blood pressure and normal or supranormal cardiac output, signs of tissue hypoperfusion may persist. This is often called "distributive shock" and may be related to maldistribution and blood flow at the regional or microvascular level and/or a cellular inability to utilize oxygen despite adequate oxygen delivery. It is clinically important that tissue hypoperfusion be recognized, despite what may appear to be "normal" blood pressures, and should trigger
timely intervention. According to the present invention such an intervention is the administration of an anti-adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition of a patient for prevention or reduction of organ dysfunction.

An antibody according to the present invention is a protein including one or more polypeptides substantially encoded by immunoglobulin genes that specifically binds an antigen. The recognized immunoglobulin genes include the kappa, lambda, alpha (IgA), gamma (IgG1, IgG2, IgG3, IgG4), delta (IgD), epsilon (IgE) and mu (IgM) constant region genes, as well as the myriad immunoglobulin variable region genes. Full-length immunoglobulin light chains are generally about 25 Kd or 214 amino acids in length. Full-length immunoglobulin heavy chains are generally about 50 Kd or 446 amino acid in length. Light chains are encoded by a variable region gene at the NH2-terminus (about 110 amino acids in length) and a kappa or lambda constant region gene at the COOH-terminus. Heavy chains are similarly encoded by a variable region gene (about 116 amino acids in length) and one of the other constant region genes.

The basic structural unit of an antibody is generally a tetramer that consists of two identical pairs of immunoglobulin chains, each pair having one light and one heavy chain. In each pair, the light and heavy chain variable regions bind to an antigen, and the constant regions mediate effector functions. Immunoglobulins also exist in a variety of other forms including, for example, Fv, Fab, and (Fab')2, as well as bifunctional hybrid antibodies and single chains (e.g., Lanzavecchia et al., Eur. J. Immunol. 17:105,1987; Huston et al., Proc. Natl. Acad. Sci. U.S.A., 85:5879-5883, 1988; Bird et al., Science 242:423-426, 1988; Hood et al., Immunology, Benjamin, N.Y., 2nd ed., 1984; Hunkapiller and Hood, Nature 323:15-16,1986).

An immunoglobulin light or heavy chain variable region includes a framework region interrupted by three hypervariable regions, also called complementarity determining regions (CDR's) (see, Sequences of Proteins of Immunological Interest, E. Kabat et al., U.S. Department of Health and Human Services, 1983). As noted above, the CDRs are primarily responsible for binding to an epitope of an antigen. An immune complex is an antibody, such as a monoclonal antibody, chimeric antibody, humanized antibody or human antibody, or functional antibody fragment, specifically bound to the antigen.

Chimeric antibodies are antibodies whose light and heavy chain genes have been constructed, typically by genetic engineering, from immunoglobulin variable and constant region genes.
belonging to different species. For example, the variable segments of the genes from a mouse monoclonal antibody can be joined to human constant segments, such as kappa and gamma 1 or gamma 3. In one example, a therapeutic chimeric antibody is thus a hybrid protein composed of the variable or antigen-binding domain from a mouse antibody and the constant or effector domain from a human antibody, although other mammalian species can be used, or the variable region can be produced by molecular techniques. Methods of making chimeric antibodies are well known in the art, e.g., see U.S. Patent No. 5,807,715. A "humanized" immunoglobulin is an immunoglobulin including a human framework region and one or more CDRs from a non-human (such as a mouse, rat, or synthetic) immunoglobulin. The non-human immunoglobulin providing the CDRs is termed a "donor" and the human immunoglobulin providing the framework is termed an "acceptor." In one embodiment, all the CDRs are from the donor immunoglobulin in a humanized immunoglobulin. Constant regions need not be present, but if they are, they must be substantially identical to human immunoglobulin constant regions, i.e., at least about 85-90%, such as about 95% or more identical. Hence, all parts of a humanized immunoglobulin, except possibly the CDRs, are substantially identical to corresponding parts of natural human immunoglobulin sequences. A "humanized antibody" is an antibody comprising a humanized light chain and a humanized heavy chain immunoglobulin. A humanized antibody binds to the same antigen as the donor antibody that provides the CDRs. The acceptor framework of a humanized immunoglobulin or antibody may have a limited number of substitutions by amino acids taken from the donor framework. Humanized or other monoclonal antibodies can have additional conservative amino acid substitutions which have substantially no effect on antigen binding or other immunoglobulin functions. Exemplary conservative substitutions are those such as gly, ala; val, ile, leu; asp, glu; asn, gln; ser, thr; lys, arg; and phe, tyr. Humanized immunoglobulins can be constructed by means of genetic engineering (e.g., see U.S. Patent No. 5,585,089). A human antibody is an antibody wherein the light and heavy chain genes are of human origin. Human antibodies can be generated using methods known in the art. Human antibodies can be produced by immortalizing a human B cell secreting the antibody of interest. Immortalization can be accomplished, for example, by EBV infection or by fusing a human B cell with a myeloma or hybridoma cell to produce a trioma cell. Human antibodies can also be produced by phage display methods (see, e.g., Dower et al., PCT Publication No. WO91/17271; McCafferty et al., PCT Publication No. WO92/001047; and Winter, PCT Publication No. WO92/20791), or selected from a human combinatorial monoclonal antibody library (see the Morphosys website). Human antibodies can also be prepared by using transgenic animals.
carrying a human immunoglobulin gene (for example, see Lonberg et al., PCT Publication No. WO93/12227; and Kucherlapati, PCT Publication No. WO91/10741).

Thus, the anti-ADM antibody or an anti-adrenomedullin antibody fragment may have the formats known in the art. Examples are human antibodies, monoclonal antibodies, humanized antibodies, chimeric antibodies, CDR-grafted antibodies. In a preferred embodiment antibodies according to the present invention are recombinantly produced antibodies as e.g. IgG, a typical full-length immunoglobulin, or antibody fragments containing at least the F- variable domain of heavy and/or light chain as e.g. chemically coupled antibodies (fragment antigen binding) including but not limited to Fab-fragments including Fab minibodies, single chain Fab antibody, monovalent Fab antibody with epitope tags, e.g. Fab-V5Sx2; bivalent Fab (mini-antibody) dimerized with the CH3 domain; bivalent Fab or multivalent Fab, e.g. formed via multimerization with the aid of a heterologous domain, e.g. via dimerization of dHLX domains, e.g. Fab-dHLX-FSx2; F(ab')2-fragments, scFv-fragments, multimerized multivalent or/and multispecific scFv-fragments, bivalent and/or bispecific diabodies, BITE® (bispecific T-cell engager), trifunctional antibodies, polyvalent antibodies, e.g. from a different class than G, single-domain antibodies, e.g. nanobodies derived from camelid or fish immunoglobulines and numerous others.

Furthermore, in one embodiment of the invention an anti-Adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or an anti-ADM non-Ig scaffold is monospecific. Monospecific anti-Adrenomedullin (ADM) antibody or monospecific anti-adrenomedullin antibody fragment or monospecific anti-ADM non-Ig scaffold means that said antibody or antibody fragment or non-Ig scaffold binds to one specific region encompassing at least 5 amino acids within the target ADM.

Monospecific anti-Adrenomedullin (ADM) antibody or monospecific anti-adrenomedullin antibody fragment or monospecific anti-ADM non-Ig scaffold are anti-Adrenomedullin (ADM) antibodies or anti-adrenomedullin antibody fragments or anti-ADM non-Ig scaffolds that all have affinity for the same antigen.

In another preferred embodiment of the invention an anti-Adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or an anti-ADM non-Ig scaffold is monospecific.
Monospecific anti-Adrenomedullin (ADM) antibody or monospecific anti-adrenomedullin antibody fragment or monospecific anti-ADM non-Ig scaffold means that said antibody or antibody fragment or non-Ig scaffold binds to one specific region encompassing at least 4 amino acids within the target ADM.

In another special embodiment the anti-ADM antibody or the antibody fragment binding to ADM is a monospecific antibody. Monospecific means that said antibody or antibody fragment binds to one specific region encompassing at least 5 amino acids within the target ADM.

In another special and preferred embodiment the anti-ADM antibody or the antibody fragment binding to ADM is a monospecific antibody. Monospecific means that said antibody or antibody fragment binds to one specific region encompassing at least 4 amino acids within the target ADM.

Monospecific antibodies or fragments are antibodies or fragments that all have affinity for the same antigen. Monoclonal antibodies are monospecific, but monospecific antibodies may also be produced by other means than producing them from a common germ cell.

In addition to anti-ADM antibodies other biopolymer scaffolds are well known in the art to complex a target molecule and have been used for the generation of highly target specific biopolymers. Examples are aptamers, spiegelmers, anticalins and conotoxins. For illustration of antibody formats please see Fig. 1a, 1b and 1c.

In a preferred embodiment the anti-ADM antibody format is selected from the group comprising Fv fragment, scFv fragment, Fab fragment, scFab fragment, F(ab)_2 fragment and scFv-Fc Fusion protein. In another preferred embodiment the antibody format is selected from the group comprising scFab fragment, Fab fragment, scFv fragment and bioavailability optimized conjugates thereof, such as PEGylated fragments. One of the most preferred formats is the scFab format.

Non-Ig scaffolds may be protein scaffolds and may be used as antibody mimics as they are capable to bind to ligands or antigens. Non-Ig scaffolds may be selected from the group comprising tetranectin-based non-Ig scaffolds (e.g. described in US 2010/0028995),
fibronectin scaffolds (e.g. described in EP 1266 025; lipocalin-based scaffolds (e.g. described in WO 2011/154420); ubiquitin scaffolds (e.g. described in WO 2011/073214), transferring scaffolds (e.g. described in US 2004/0023334), protein A scaffolds (e.g. described in EP 2231860), ankyrin repeat based scaffolds (e.g. described in WO 2010/060748), microproteins preferably microproteins forming a cystine knot) scaffolds (e.g. described in EP 2314308), Fyn SH3 domain based scaffolds (e.g. described in WO 2011/023685) EGFR-A-domain based scaffolds (e.g. described in WO 2005/040229) and Kunitz domain based scaffolds (e.g. described in EP 1941867).

In one embodiment of the invention anti-ADM antibodies according to the present invention may be produced as follows:

A Balb/c mouse was immunized with 100µg ADM-Peptide (antigen)-BSA-Conjugate at day 0 and 14 (emulsified in 100µl complete Freund’s adjuvant) and 50µg at day 21 and 28 (in 100µl incomplete Freund’s adjuvant). Three days before the fusion experiment was performed, the animal received 50µg of the conjugate dissolved in 100µl saline, given as one intraperitoneal and one intra-venous injection.

Spenocytes from the immunized mouse and cells of the myeloma cell line SP2/0 were fused with 1ml 50% polyethylene glycol for 30s at 37°C. After washing, the cells were seeded in 96-well cell culture plates. Hybrid clones were selected by growing in HAT medium [RPMI 1640 culture medium supplemented with 20% fetal calf serum and HAT-Supplement]. After two weeks the HAT medium is replaced with HT Medium for three passages followed by returning to the normal cell culture medium.

The cell culture supernatants were primary screened for antigen specific IgG antibodies three weeks after fusion. The positive tested microcultures were transferred into 24-well plates for propagation. After retesting, the selected cultures were cloned and recloned using the limiting-dilution technique and the isotypes were determined. (see also Lane, R.D. (1985). A short-duration polyethylene glycol fusion technique for increasing production of monoclonal antibody-secreting hybridomas. J. Immunol. Meth. 81: 223-228; Ziegler, B. et al.(1996) Glutamate decarboxylase (GAD) is not detectable on the surface of rat islet cells examined by cytofluorometry and complement-dependent antibody-mediated cytotoxicity of monoclonal GAD antibodies, Horm. Metab. Res. 28: 11-15).
Antibodies may be produced by means of phage display according to the following procedure:
The human naive antibody gene libraries HAL7/8 were used for the isolation of recombinant single chain F-Variable domains (scFv) against adrenomedullin peptide. The antibody gene libraries were screened with a panning strategy comprising the use of peptides containing a biotin tag linked via two different spacers to the adrenomedullin peptide sequence. A mix of panning rounds using non-specifically bound antigen and streptavidin bound antigen were used to minimize background of non-specific binders. The eluted phages from the third round of panning have been used for the generation of monoclonal scFv expressing E.coli strains. Supernatant from the cultivation of these clonal strains has been directly used for an antigen ELISA testing (see also Hust, M., Meyer, T., Voedsch, B., Rücker, T., Thie, H., El-Ghezal, A., Kirsch, M.I., Schütte, M., Helmsing, S., Meier, D., Schirrmann, T., Dübel, S., 2011. A human scFv antibody generation pipeline for proteome research. Journal of Biotechnology 152, 159–170; Schütte, M., Thullier, P., Pelat, T., Wezler, X., Rosenstock, P., Hinz, D., Kirsch, M.I., Hasenberg, M., Frank, R., Schirrmann, T., Gunzer, M., Hust, M., Dübel, S., 2009. Identification of a putative Crf splice variant and generation of recombinant antibodies for the specific detection of Aspergillus fumigatus. PLoS One 4, e6625).

Humanization of murine antibodies may be conducted according to the following procedure:
For humanization of an antibody of murine origin the antibody sequence is analyzed for the structural interaction of framework regions (FR) with the complementary determining regions (CDR) and the antigen. Based on structural modeling an appropriate FR of human origin is selected and the murine CDR sequences are transplanted into the human FR. Variations in the amino acid sequence of the CDRs or FRs may be introduced to regain structural interactions, which were abolished by the species switch for the FR sequences. This recovery of structural interactions may be achieved by random approach using phage display libraries or via directed approach guided by molecular modeling. (Almagro JC, Fransson J., 2008. Humanization of antibodies. Front Biosci. 2008 Jan 1;13:1619-33.)

In a preferred embodiment the ADM antibody format is selected from the group comprising Fv fragment, scFv fragment, Fab fragment, scFab fragment, F(ab)2 fragment and scFv-Fe Fusion protein. In another preferred embodiment the antibody format is selected from the group comprising scFab fragment, Fab fragment, scFv fragment and bioavailability optimized
conjugates thereof, such as PEGylated fragments. One of the most preferred formats is scFab format.

In another preferred embodiment, the anti-ADM antibody, anti-ADM antibody fragment, or anti-ADM non-Ig scaffold is a full length antibody, antibody fragment, or non-Ig scaffold.

In a preferred embodiment the anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold is directed to and can bind to an epitope of at least 5 amino acids in length contained in ADM.

In a more preferred embodiment the anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold is directed to and can bind to an epitope of at least 4 amino acids in length contained in ADM.

In a preferred embodiment of the present invention said anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold binds to a region of ADM that is located in the N-terminal part (aa 1-21) of adrenomedullin, (see Fig. 2).

In another preferred embodiment said antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold recognizes and binds to the N-terminal end (aa1) of adrenomedullin. N-terminal end means that the amino acid 1, that is “Y” of SEQ ID No. 21 or 23; is mandatory for binding. The antibody or fragment or scaffold would neither bind N-terminal extended nor N-terminal modified adrenomedullin nor N-terminal degraded adrenomedullin.

In one specific embodiment of the invention the anti-Adrenomedullin (ADM) antibody or anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin is provided for use in therapy of an acute disease or acute condition of a patient wherein said antibody or antibody fragment or non-Ig scaffold binds to a region of preferably at least 4, or at least 5 amino acids within the sequence of aa 1-42 of mature human ADM:

SEQ ID No: 24
YRQSMNNFQGLRSFGCRFGTCTVQKLAHQIYQFTDKDKDNVA.
In one specific embodiment of the invention the anti-Adrenomedullin (ADM) antibody or anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin is provided for use in therapy of an acute disease or acute condition of a patient wherein said antibody or fragment or scaffold binds to a region of preferably at least 4, or at least 5 amino acids within the sequence of aa 1-21 of mature human ADM:

SEQ ID No: 23
YRQSMNNFQGLRSFGCRFGTC.

In another specific embodiment pursuant to the invention the herein provided anti-ADM antibody or anti-ADM antibody fragment or anti-ADM non-Ig scaffold does not bind to the C-terminal portion of ADM, i.e. the aa 43 – 52 of ADM (SEQ ID NO: 25)

PRSKISPQGY-NH2

(SEQ ID NO: 25).

In one specific embodiment it is preferred to use an anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold according to the present invention, wherein said anti-adrenomedullin antibody or said anti-adrenomedullin antibody fragment or non-Ig scaffold is an ADM stabilizing antibody or an adrenomedullin stabilizing antibody fragment or an adrenomedullin stabilizing non-Ig scaffold that enhances the half life (t_{1/2}; half retention time) of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least 50 %, more preferably >50 %, most preferably >100 %.

The half life (half retention time) of ADM may be determined in human plasma in absence and presence of an ADM stabilizing antibody or an adrenomedullin stabilizing antibody fragment or an adrenomedullin stabilizing non-Ig scaffold, respectively, using an immunoassay for the quantification of ADM.

The following steps may be conducted:
- ADM may be diluted in human citrate plasma in absence and presence of an ADM stabilizing antibody or an adrenomedullin stabilizing antibody fragment or an
adrenomedullin stabilizing non-Ig scaffold, respectively, and may be incubated at 24 °C.

- Aliquots are taken at selected time points (e.g. within 24 hours) and degradation of ADM may be stopped in said aliquots by freezing at -20 °C.

- The quantity of ADM may be determined by an hADM immunoassay directly, if the selected assay is not influenced by the stabilizing antibody. Alternatively, the aliquot may be treated with denaturing agents (like HCl) and, after clearing the sample (e.g. by centrifugation) the pH can be neutralized and the ADM-quantified by an ADM immunoassay. Alternatively, non-immunoassay technologies (e.g. rpHPLC) can be used for ADM-quantification.

- The half life of ADM is calculated for ADM incubated in absence and presence of an ADM stabilizing antibody or an adrenomedullin stabilizing antibody fragment or an adrenomedullin stabilizing non-Ig scaffold, respectively.

- The enhancement of half life is calculated for the stabilized ADM in comparison to ADM that has been incubated in absence of an ADM stabilizing antibody or an adrenomedullin stabilizing antibody fragment or an adrenomedullin stabilizing non-Ig scaffold.

A two-fold increase of the half life of ADM is an enhancement of half life of 100%.

Half Life (half retention time) is defined as the period over which the concentration of a specified chemical or drug takes to fall to half baseline concentration in the specified fluid or blood.

An assay that may be used for the determination of the Half life (half retention time) of adrenomedullin in serum, blood, plasma is described in Example 3.

For some diseases blocking of ADM may be beneficial to a certain extent. However, it might also be detrimental if ADM is totally neutralized as a certain amount of ADM may be required for several physiological functions. In many reports it was emphasized that the administration of ADM may be beneficial in certain diseases. In contrast thereto in other reports ADM was reported as being life threatening when administered in certain conditions.
In a preferred embodiment said anti-ADM antibody, anti-ADM antibody fragment or anti-ADM non-Ig scaffold is a non-neutralizing antibody, fragment or scaffold. A neutralizing anti-ADM antibody, anti-ADM antibody fragment or anti-ADM non-Ig scaffold would block the bioactivity of ADM to nearly 100%, to at least more than 90%, preferably to at least more than 95%.

In contrast, a non-neutralizing anti-ADM antibody, or anti-ADM antibody fragment or anti-ADM non-Ig scaffold blocks the bioactivity of ADM less than 100%, preferably to less than 95%, preferably to less than 90%, more preferred to less than 80% and even more preferred to less than 50%. This means that the residual bioactivity of ADM bound to the non-neutralizing anti-ADM antibody, or anti-ADM antibody fragment or anti-ADM non-Ig scaffold would be more than 0%, more preferred more than 5%, preferably more than 10%, more preferred more than 20%, more preferred more than 50%.

In this context (a) molecule(s), being it an antibody, or an antibody fragment or a non-Ig scaffold with “non-neutralizing anti-ADM activity”, collectively termed here for simplicity as “non-neutralizing” anti-ADM antibody, antibody fragment, or non-Ig scaffold, that e.g. blocks the bioactivity of ADM to less than 80%, is defined as

- a molecule or molecules binding to ADM, which upon addition to a culture of an eukaryotic cell line, which expresses functional human recombinant ADM receptor composed of CRLR (calcitonin receptor like receptor) and RAMP3 (receptor-activity modifying protein 3), reduces the amount of cAMP produced by the cell line through the action of parallel added human synthetic ADM peptide, wherein said added human synthetic ADM is added in an amount that in the absence of the non-neutralizing antibody to be analyzed, leads to half-maximal stimulation of cAMP synthesis, wherein the reduction of cAMP by said molecule(s) binding to ADM takes place to an extent, which is not more than 80%, even when the non-neutralizing molecule(s) binding to ADM to be analyzed is added in an amount, which is 10-fold more than the amount, which is needed to obtain the maximal reduction of cAMP synthesis obtainable with the non-neutralizing antibody to be analyzed.

The same definition applies to the other ranges; 95%, 90%, 50% etc.
In a specific embodiment according to the present invention an anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold is used, wherein said antibody or an anti-adrenomedullin antibody fragment blocks the bioactivity of ADM to less than 80%, preferably less than 50% (of baseline values). This means the antibody, antibody fragment or non-Ig scaffold pursuant to the invention blocks the bioactivity of ADM to not more than 80%, or not more than 50%, respectively. By implication, this means at least 20% residual ADM bioactivity or at least 50% residual ADM bioactivity is present when using an antibody, antibody fragment or non-Ig scaffold in accordance with the invention. It has been understood that said limited blocking of the bioactivity of ADM occurs even at excess concentration of the antibody, fragment or scaffold, meaning an excess of the antibody, fragment or scaffold in relation to ADM. Said limited blocking is an intrinsic property of the ADM binder itself. This means that said antibody, fragment or scaffold has a maximal inhibition of 80% or 50% respectively. In a preferred embodiment said anti-ADM antibody, anti-ADM antibody fragment or anti-ADM non-Ig scaffold would block the bioactivity of ADM to at least 5%. By implication, this means approximately 95% residual ADM bioactivity is present.

The bioactivity is defined as the effect that a substance takes on a living organism or tissue or organ or functional unit in vivo or in vitro (e.g. in an assay) after its interaction. In case of ADM bioactivity this may be the effect of ADM in a human recombinant Adrenomedullin receptor cAMP functional assay. Thus, according to the present invention bioactivity is defined via an Adrenomedullin receptor cAMP functional assay. The following steps may be performed in order to determine the bioactivity of ADM in such an assay:

- Dose response curves are performed with ADM in said human recombinant Adrenomedullin receptor cAMP functional assay.
- The ADM-concentration of half-maximal cAMP stimulation may be calculated.
- At constant half-maximal cAMP-stimulating ADM-concentrations dose response curves (up to 100μg/ml final concentration) are performed by an ADM stabilizing antibody or an adrenomedullin stabilizing antibody fragment or an adrenomedullin stabilizing non-Ig scaffold, respectively,

A maximal inhibition in said ADM bioassay of 50% means that said anti-ADM antibody or said anti-ADM antibody fragment or said anti-ADM non-Ig scaffold, respectively, blocks the
bioactivity to 50% of baseline values. A maximal inhibition in said ADM bioassay of 80% means that said anti-ADM antibody or said anti-adrenomedullin antibody fragment or said anti-adrenomedullin non-Ig scaffold, respectively, blocks the bioactivity of ADM to 80%. This is in the sense of blocking the ADM bioactivity to not more than 80%. This means approximately 20% residual ADM bioactivity remains present.

However, by the present specification and in the above context the expression "blocks the bioactivity of ADM" in relation to the herein disclosed anti-ADM antibodies, anti-ADM antibody fragments, and anti-ADM non-Ig scaffolds should be understood as mere decreasing the bioactivity of ADM from 100% to 20% remaining ADM bioactivity at maximum, preferably decreasing the ADM bioactivity from 100% to 50% remaining ADM bioactivity; but in any case there is ADM bioactivity remaining that can be determined as detailed above.

The bioactivity of ADM may be determined in a human recombinant Adrenomedullin receptor cAMP functional assay (Adrenomedullin Bioassay) according to Example 2.

In a preferred embodiment a modulating anti-ADM antibody or a modulating anti-ADM antibody fragment is used in the treatment of sepsis. A modulating anti-ADM antibody or a modulating anti-adrenomedullin antibody fragment enhances the bioactivity of ADM in the early phase of sepsis and reduces the damaging effects of ADM in the late phase of sepsis. A "modulating" anti-ADM antibody or a modulating anti-adrenomedullin antibody fragment is an antibody that enhances the half life (t1/2 half retention time) of adrenomedullin in serum, blood, plasma at least 10%, preferably at least, 50%, more preferably >50%, most preferably >100% and blocks the bioactivity of ADM to less than 80%, preferably less than 50%.

In a preferred embodiment a modulating anti-ADM antibody or a modulating anti-adrenomedullin antibody fragment or a modulating anti-adrenomedullin non-Ig scaffold is used in therapy of a chronic or acute disease or acute condition of a patient for stabilizing the circulation, in particular for stabilizing the systemic circulation.

Such a modulating antibody or a modulating anti-adrenomedullin antibody fragment or a modulating anti-adrenomedullin non-Ig scaffold may be especially useful in the treatment of sepsis. A modulating antibody or a modulating anti-adrenomedullin antibody fragment or a
modulating anti-adrenomedullin non-Ig scaffold enhances the bioactivity of ADM in the early phase of sepsis and reduces the damaging effects of ADM in the late phase of sepsis.

In a preferred embodiment the anti-adrenomedullin antibody or an anti-adrenomedullin antibody fragment or anti-adrenomedullin non-Ig scaffold is directed to and can bind to an epitope of at least 5 amino acids in length contained in ADM, preferably in human ADM.

In a more preferred embodiment the anti-adrenomedullin antibody or an anti-adrenomedullin antibody fragment or anti-adrenomedullin non-Ig scaffold is directed to and can bind to an epitope of at least 4 amino acids in length contained in ADM, preferably in human ADM.

A “modulating” anti-ADM antibody or a modulating anti-adrenomedullin antibody fragment or a modulating anti-adrenomedullin non-Ig scaffold is an antibody or an anti-adrenomedullin antibody fragment or non-Ig scaffold that enhances the half life ($t_{1/2}$ half retention time) of adrenomedullin in serum, blood, plasma at least 10%, preferably at least, 50%, more preferably >50%, most preferably >100% and blocks the bioactivity of ADM to less than 80%, preferably less than 50% and wherein said anti-ADM antibody, anti-ADM antibody fragment or anti-ADM non-Ig scaffold would block the bioactivity of ADM to at least 5%. These values related to half-life and blocking of bioactivity have to be understood in relation to the before-mentioned assays in order to determine these values. This is in the sense of blocking the ADM of not more than 80% or not more than 50%, respectively.

Such a modulating anti-adrenomedullin antibody or a modulating anti-adrenomedullin antibody fragment or a modulating anti-adrenomedullin non-Ig scaffold offers the advantage that the dosing of the administration is facilitated. The combination of partially blocking or partially reducing Adrenomedullin bioactivity and increase of the in vivo half life (increasing the Adrenomedullin bioactivity) leads to beneficial simplicity of anti-adrenomedullin antibody or an anti-adrenomedullin antibody fragment or anti-adrenomedullin non-Ig scaffold dosing. In a situation of excess of endogenous Adrenomedullin (maximal stimulation, late sepsis phase, shock, hypodynamic phase) the activity lowering effect is the major impact of the antibody or fragment or scaffold, limiting the (negative) effect of Adrenomedullin. In case of low or normal endogenous Adrenomedullin concentrations, the biological effect of anti-adrenomedullin antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold is a combination of lowering (by partially blocking) and increase by increasing the Adrenomedullin half life. If the half life effect is stronger than the net blocking effect, the
biological activity of endogenous Adrenomedullin is beneficially increased in early phases of Sepsis (low Adrenomedullin, hyperdynamic phase). Thus, the non-neutralizing and modulating anti-antibody or anti-adrenomedullin antibody fragment or anti-adrenomedullin non-Ig scaffold acts like an ADM bioactivity buffer in order to keep the bioactivity of ADM within a certain physiological range.

Thus, the dosing of the antibody/fragment/scaffold in e.g. sepsis may be selected from an excessive concentration, because both Sepsis phases (early and late) benefit from excessive anti-ADM antibody or an anti-ADM antibody fragment or anti-ADM non-Ig scaffold treatment in case of a modulating effect. Excessive means: The anti-adrenomedullin antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold concentration is higher than endogenous Adrenomedullin during late phase (shock) of e.g. sepsis. This means, in case of a modulating antibody or modulating fragment or modulating scaffold dosing in sepsis may be as follows:

The concentration of Adrenomedullin in septic shock is 226+/-66 fmol/ml (Nishio et al., "Increased plasma concentrations of adrenomedullin correlate with relaxation of vascular tone in patients with septic shock.", Crit Care Med. 1997, 25(6):953-7), an equimolar concentration of antibody or fragment or scaffold is 42.5µg/l blood, (based on 6 l blood volume / 80kg body weight) 3.2µg/kg body weight. Excess means at least double (mean) septic shock Adrenomedullin concentration, at least > 3µg anti-adrenomedullin antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig Scaffold / kg body weight, preferred at least 6.4µg anti-adrenomedullin antibody or an anti-adrenomedullin antibody fragment anti-ADM non-Ig Scaffold /kg body weight. Preferred > 10µg / kg, more preferred >20µg/kg, most preferred >100µg anti-adrenomedullin antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold / kg body weight.

This may apply to other severe and acute conditions than septic shock as well.

In a specific embodiment of the invention the antibody is a monoclonal antibody or a fragment thereof. In one embodiment of the invention the anti-ADM antibody or the anti-ADM antibody fragment is a human or humanized antibody or derived therefrom. In one specific embodiment one or more (murine) CDR’s are grafted into a human antibody or antibody fragment.
Subject matter of the present invention in one aspect is a human CDR-grafted antibody or antibody fragment thereof that binds to ADM, wherein the human CDR-grafted antibody or antibody fragment thereof comprises an antibody heavy chain (H chain) comprising

SEQ ID NO: 1
GYTFSRYW

SEQ ID NO: 2
ILPGSGST

and/or

SEQ ID NO: 3
TEGYEYDGFDY

and/or further comprises an antibody light chain (L chain) comprising:

SEQ ID NO: 4
QSIVYSNGNTY

SEQ ID NO: 5
RVS

and/or

SEQ ID NO: 6
FQGSHIPYT.

In one specific embodiment of the invention subject matter of the present invention is a human monoclonal antibody that binds to ADM or an antibody fragment thereof wherein the heavy chain comprises at least one CDR selected from the group comprising:

SEQ ID NO: 1
GYTFSRYW

SEQ ID NO: 2
ILPGSGST

SEQ ID NO: 3
TEGYEYDGFDY

and wherein the light chain comprises at least one CDR selected from the group comprising:

SEQ ID No: 4
QSIVYSNGNTY

SEQ ID NO: 5
RVS

SEQ ID NO: 6
FQGSHIPYT.

In a more specific embodiment of the invention subject matter of the invention is a human monoclonal antibody that binds to ADM or an antibody fragment thereof wherein the heavy chain comprises the sequences

SEQ ID NO: 1
GYTFSRYW

SEQ ID NO: 2
ILPGSGST

SEQ ID NO: 3
TEGYEYDGFDY

and wherein the light chain comprises the sequences

SEQ ID NO: 4
QSIVYSNGNTY
In a very specific embodiment the anti-ADM antibody has a sequence selected from the group comprising: SEQ ID NO 7, 8, 9, 10, 11, 12, 13 and 14.

The anti-ADM antibody or anti-ADM antibody fragment or anti-ADM non-Ig scaffold according to the present invention exhibits an affinity towards human ADM in such that affinity constant is greater than $10^{-7}$ M, preferred $10^{-9}$ M, preferred affinity is greater than $10^{-9}$ M, most preferred higher than $10^{-10}$ M. A person skilled in the art knows that it may be considered to compensate lower affinity by applying a higher dose of compounds and this measure would not lead out-of-the-scope of the invention. The affinity constants may be determined according to the method as described in Example 1.

In a preferred embodiment the anti-ADM antibody or the anti-ADM antibody fragment or the anti-ADM non-Ig scaffold is used for reducing the risk of mortality during said chronic or acute disease or acute condition of a patient.

Chronic or acute disease or acute condition according to the present invention may be a disease or condition selected from the group comprising severe infections as e.g. meningitis, Systemic inflammatory Response-Syndrome (SIRS) sepsis; other diseases as diabetes, cancer, acute and chronic vascular diseases as e.g. heart failure, myocardial infarction, stroke, atherosclerosis; shock as e.g. septic shock and organ dysfunction as e.g. kidney dysfunction, liver dysfunction, burnings, surgery, traumata, poisoning, damages by chemotherapy. Especially useful is the antibody or fragment or scaffold according to the present invention for reducing the risk of mortality during sepsis and septic shock, i.e. late phases of sepsis.

In a preferred embodiment the antibody or the antibody fragment is used for reducing the risk of mortality during said chronic or acute disease of a patient wherein said disease is selected from the group comprising sepsis, diabetis, cancer, acute and chronic vascular diseases as e.g. heart failure, shock as e.g. septic shock and organ dysfunction as e.g. kidney dysfunction.
Especially useful is the antibody or fragment according to the present invention for reducing the risk of mortality during sepsis and septic shock, i.e. late phases of sepsis.

In a preferred embodiment a modulating antibody or a modulating adrenomedullin antibody fragment is used in the treatment of sepsis. A modulating antibody enhances the bioactivity of ADM in the early phase of sepsis and reduces the damaging effects of ADM in the late phase of sepsis. A “modulating” antibody or an adrenomedullin antibody fragment is an antibody that enhances the $t_{1/2}$ half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably >50 %, most preferably >100% and blocks the bioactivity of ADM to less than 80 %, preferably less than 50 %.

In one embodiment the anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig Scaffold is used in therapy of a chronic or acute disease or acute condition of a patient according to the present invention wherein said patient is an ICU patient. In another embodiment the anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold is used in therapy of a chronic or acute disease of a patient according to the present invention wherein said patient is critically ill. Critically ill means a patient is having a disease or state in which death is possible or imminent.

Subject of the present invention is further an anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition of a patient according to the present invention wherein said antibody or fragment or scaffold is to be used in combination of ADM binding protein. ADM binding protein is also naturally present in the circulation of said patient.

It should be emphasized that the term ADM binding protein also denotes ADM-binding-protein-1 (complement factor H), which however is not a non-neutralizing and modulating anti-ADM antibody, anti-ADM antibody fragment, or anti-ADM non-Ig scaffold as in accordance with the invention.

Subject of the present invention is further an anti-ADM antibody or an anti-ADM antibody fragment or anti-ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition of a patient according to the present invention wherein said antibody or fragment or scaffold is to be used in combination with further active ingredients.
Subject matter of the invention is also an anti-adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or an anti-ADM non-Ig scaffold to be used in combination with a primary medicament wherein said combination is for use in therapy of a chronic or acute disease or acute condition of a patient for prevention or reduction of organ dysfunction or organ failure in said patient.

Primary medicament means a medicament that acts against the primary cause of said disease or condition said primary medicament may be antibiotics in case of infections.

In a specific embodiment of the before mentioned combinations said combinations are to be used in combination with vasopressors e.g. catecholamine wherein said further combination is for use in therapy of a chronic or acute disease or condition of a patient for prevention or reduction of organ dysfunction or organ failure in said patient.

In one embodiment of the invention said patient having a chronic or acute disease or chronic condition being in need for prevention or reduction of organ dysfunction or organ failure in said patient is characterized by the need of the patient to get administration of vasopressors e.g. catecholamine administration.

Subject matter of the invention in one specific embodiment is, thus, an anti-adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or an anti-ADM non-Ig scaffold to be used in combination with ADM binding protein and/or further active ingredients for use in therapy of a patient in need of a treatment of vasopressors e.g. catecholamine treatment.

In a specific embodiment of the above mentioned combinations said combinations are to be used in combination with fluids administered intravenously, wherein said combination is for use in therapy of a chronic or acute disease or condition of a patient for prevention or reduction of organ dysfunction or organ failure in said patient.

In one embodiment of the invention said patient having a chronic or acute disease or acute condition being in need for prevention or reduction of organ dysfunction or organ failure in said patient is characterized by the need of the patient to get intravenous fluids.

Subject matter of the invention in one specific embodiment is, thus, an anti-adrenomedullin (ADM) antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold
in combination with ADM binding protein and/or further active ingredients for use in therapy of a patient in need of intravenous fluids.

In accordance with the invention the ADM-binding-Protein-1 may be also referred to as ADM-binding-Protein-1 (complement factor H).

In one specific embodiment of the invention the anti-adrenomedullin (ADM) antibody or anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin is provided for use in therapy of an acute disease or acute condition of a patient wherein said antibody or fragment or scaffold is not ADM-binding-Protein-1 (complement factor H).

It should be emphasized that the term ADM binding protein also denotes ADM-binding-protein-1 (complement factor H), which however is not a non-neutralizing and modulating anti-ADM antibody, anti-ADM antibody fragment, or anti-ADM non-Ig scaffold as in accordance with the invention.

Said anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold or combinations thereof with ADM binding protein and/or further active ingredients may be used in combination with vasopressors e.g. catecholamine and/or with fluids administered intravenously for use in a of a chronic or acute disease or acute condition of a patient for prevention or reduction of organ dysfunction or organ failure in said patient.

Subject matter of the invention is also an anti-ADM antibody or an anti-adrenomedullin antibody fragment or anti-ADM non-Ig scaffold according to the present invention to be used in combination with TNF-alpha-antibodies. TNF-alpha-antibodies are commercially available for the treatment of patients.

Subject of the present invention is further a pharmaceutical formulation comprising an antibody or fragment or scaffold according to the present invention. Subject of the present invention is further a pharmaceutical formulation according to the present invention wherein said pharmaceutical formulation is a solution, preferably a ready-to-use solution.
Said pharmaceutical formulation may be administered intra-muscular. Said pharmaceutical formulation may be administered intra-vascular. Said pharmaceutical formulation may be administered via infusion. In another embodiment subject of the present invention is further a pharmaceutical formulation according to the present invention wherein said pharmaceutical formulation is in a dried state to be reconstituted before use.

In another embodiment subject of the present invention is further a pharmaceutical formulation according to the present invention wherein said pharmaceutical formulation is in a freeze-dried state.

In another embodiment subject of the present invention is further a pharmaceutical formulation according to the present invention wherein said pharmaceutical formulation is administered intra-muscular.

In another embodiment subject of the present invention is further a pharmaceutical formulation according to the present invention wherein said pharmaceutical formulation is administered intra-vascular.

In another embodiment subject of the present invention is further a pharmaceutical formulation according to the present invention wherein said pharmaceutical formulation is administered via infusion.

It should be emphasized that the pharmaceutical formulation in accordance with the invention as may be administered intra-muscular, intra-vascular, or via infusion is preferably administered systemically to a patient for prevention or reduction of organ dysfunction or organ failure in a patient having a chronic or acute disease or acute condition.

Therefore, in another embodiment of the present invention the pharmaceutical formulation according to the present invention is to be administered systemically to a patient for prevention or reduction of organ dysfunction or organ failure in a patient having a chronic or acute disease or acute condition.

In another specific and preferred embodiment of the present invention the pharmaceutical formulation according to the present invention is to be administered systemically via infusion.
to a patient for prevention or reduction of organ dysfunction or organ failure in a patient having a chronic or acute disease or acute condition.

Further embodiments within the scope of the present invention are set out below:

1. Adrenomedullin ADM antibody or an adrenomedullin antibody fragment for use in therapy of a chronic or acute disease of a patient for the regulation of liquid balance.

2. ADM antibody or an adrenomedullin antibody fragment according to claim 1 wherein the antibody format is selected from the group comprising Fv fragment, scFv fragment, Fab fragment, scFab fragment, (Fab)2 fragment and scFv-Fc Fusion protein.

3. ADM antibody or an adrenomedullin antibody fragment according claim 1 or 2 wherein said antibody or fragment binds to the N-terminal part (aa 1-21) of adrenomedullin.

4. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 3, wherein said antibody or fragment recognizes and binds to the N-terminal end (aa1) of adrenomedullin.

5. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 4, wherein said antibody or fragment is an ADM stabilizing antibody or ADM stabilizing a antibody fragment that enhances the t1/2 half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least 50 %, more preferably >50 %, most preferably >100 %.

6. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 5, wherein said antibody or fragment blocks the bioactivity of ADM to less than 80 %, preferably less than 50 %.

7. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a chronic or acute disease of a patient according to any of claims 1 to 6 wherein said disease is selected from the group comprising sepsis, diabetes, cancer, heart failure, shock and kidney dysfunction.
8. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a chronic or acute disease of a patient according to any of claims 1 to 7 wherein said patient is an ICU patient.

9. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a chronic or acute disease of a patient according to any of claims 1 to 7 wherein said antibody or fragment is a modulating antibody or fragment that enhances the t1/2 half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least 50 %, more preferably >50 %, most preferably >100 % and that blocks the bioactivity of ADM to less than 80 %, preferably less than 50%.

10. Pharmaceutical formulation comprising an antibody or fragment according to any of claims 1 to 9.

11. Pharmaceutical formulation according to claim 10 wherein said pharmaceutical formulation is a solution, preferably a ready-to-use solution.

12. Pharmaceutical formulation according to claim 10 wherein said pharmaceutical formulation is in a freeze-dried state.

13. Pharmaceutical formulation according to any of claims 10 to 11, wherein said pharmaceutical formulation is administered intra-muscular.

14. Pharmaceutical formulation according to any of claims 10 to 11, wherein said pharmaceutical formulation is administered intra-vascular.

15. Pharmaceutical formulation according to claim 14, wherein said pharmaceutical formulation is administered via infusion.

Further embodiments within the scope of the present invention are set out below:

1. Adrenomedullin ADM antibody or an adrenomedullin antibody fragment an ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition of a patient for the regulation of fluid balance.
2. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to claim 1 wherein said ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold is a non-neutralizing ADM antibody or a non-neutralizing adrenomedullin antibody fragment or a non-neutralizing ADM non-IG scaffold.

3. Adrenomedullin ADM antibody or an adrenomedullin antibody fragment or an ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition according to claim 1 or 2 for preventing or reducing edema in said patient.

4. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 3 wherein the antibody format is selected from the group comprising Fv fragment, scFv fragment, Fab fragment, scFab fragment, (Fab)2 fragment and scFv-Fc Fusion protein.

5. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 4, wherein said antibody or fragment or scaffold binds to the N-terminal part (aa 1-21) of adrenomedullin.

6. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 5, wherein said antibody or fragment scaffold recognizes and binds to the N-terminal end (aa1) of adrenomedullin.

7. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 6, wherein said antibody or fragment or scaffold is an ADM stabilizing antibody or ADM stabilizing antibody fragment or ADM stabilizing non-IG scaffold that enhances the half life (t_{1/2} half retention time) of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least 50 %, more preferably >50 %, most preferably >100 %.

8. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 7, wherein said antibody or fragment blocks the bioactivity of ADM to less than 80 %, preferably less than 50%.
9. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease of a patient according to any of claims 1 to 8 wherein said disease is selected from the group comprising SIRS, sepsis, diabetes, cancer, heart failure, shock and kidney dysfunction.

10. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 9, wherein said antibody or fragment is a human monoclonal antibody or fragment that binds to ADM or an antibody fragment thereof wherein the heavy chain comprises the sequences

SEQ ID NO: 1
GYTFSRYW

SEQ ID NO: 2
ILPGSGST

SEQ ID NO: 3
TEGYEYDGFDY

and wherein the light chain comprises the sequences

SEQ ID NO: 4
QSIVYSNGNTY

SEQ ID NO: 5
RVS

SEQ ID NO: 6
FQGSHIPYT.
11. A human monoclonal antibody or fragment that binds to \textit{ADM} or an antibody fragment thereof according to claim 10 wherein said antibody or fragment comprises a sequence selected from the group comprising:

12. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease of a patient according to any of claims 1 to 9 wherein said patient is an ICU patient.

13. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease of a patient according to any of claims 1 to 12 wherein said antibody or fragment or scaffold is a modulating antibody or fragment
or scaffold that enhances the half life (t_{1/2} half retention time) of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least 50 %, more preferably >50 %, most preferably >100 % and that blocks the bioactivity of ADM to less than 80 %, preferably less than 50%.

14. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease of a patient according to any of the claims 1 to 13 to be used in combination with catecholamine and/ or fluids administered intravenously.

15. ADM antibody or adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease of a patient according to any of the claims 1 to 13 or a combination according to claim 12 to be used in combination with ADM binding protein and/or further active ingredients.

16. Pharmaceutical formulation comprising an antibody or fragment or scaffold according to any of claims 1 to 15.

17. Pharmaceutical formulation according to claim 16 wherein said pharmaceutical formulation is a solution, preferably a ready-to-use solution.

18. Pharmaceutical formulation according to claim 16 wherein said pharmaceutical formulation is in a freeze-dried state.

19. Pharmaceutical formulation according to any of claims 16 to 17, wherein said pharmaceutical formulation is administered intra-muscular.

20. Pharmaceutical formulation according to any of claims 16 to 17, wherein said pharmaceutical formulation is administered intra-vascular.

21. Pharmaceutical formulation according to claim 20, wherein said pharmaceutical formulation is administered via infusion.

Further embodiments within the scope of the present invention are set out below:
1. Adrenomedullin (ADM) antibody or an adrenomedullin antibody fragment for use in therapy of a chronic or acute disease of a patient for stabilizing the circulation.

2. ADM antibody or an adrenomedullin antibody fragment according to claim 1 wherein said antibody or fragment reduces the catecholamine requirement of said patient.

3. ADM antibody or an adrenomedullin antibody fragment according to claim 1 or 2 wherein the antibody format is selected from the group comprising Fv fragment, scFv fragment, Fab fragment, scFab fragment, (Fab)2 fragment and scFv-Fc Fusion protein.

4. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 3 wherein said antibody or fragment binds to the N-terminal part (aa 1-21) of adrenomedullin.

5. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 4, wherein said antibody or fragment recognizes and binds to the N-terminal end (aa1) of adrenomedullin.

6. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 5, wherein said antibody or fragment is an ADM stabilizing antibody that enhances the t1/2 half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably > 50 %, most preferably >100 %.

7. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 6, wherein said antibody or fragment blocks the bioactivity of ADM to less than 80 %, preferably less than 50 %.

8. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 7, wherein said antibody or fragment is a modulating ADM antibody or a modulating adrenomedullin antibody fragment that enhances the t1/2 half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably > 50 %, most preferably >100 % and that blocks the bioactivity of ADM to less than 80 %, preferably less than 50 %:
9. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a chronic or acute disease of a patient according to any of the claims 1 to 8 wherein said disease is selected from the group comprising sepsis, diabetes, cancer, acute and chronic vascular diseases as e.g. heart failure, shock as e.g. septic shock and organ dysfunction as e.g. kidney dysfunction.

10. Pharmaceutical formulation comprising an antibody according to any of claims 1 to 9.

11. Pharmaceutical formulation according to claim 10 wherein said pharmaceutical formulation is a solution, preferably a ready-to-use solution.

12. Pharmaceutical formulation according to claim 10 wherein said pharmaceutical formulation is in a freeze-dried state.

13. Pharmaceutical formulation according to any of claims 10 to 11, wherein said pharmaceutical formulation is administered intra-muscular.

14. Pharmaceutical formulation according to any of claims 10 to 11, wherein said pharmaceutical formulation is administered intra-vascular.

15. Pharmaceutical formulation according to claim 14, wherein said pharmaceutical formulation is administered via infusion.

Further embodiments within the scope of the present invention are set out below:

1. Adrenomedullin (ADM) antibody or an adrenomedullin antibody fragment or an ADM non-IG scaffold for use in therapy of a chronic or acute disease or condition of a patient for stabilizing the circulation.

2. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to claim 1 wherein said antibody or fragment or scaffold reduces the vasopressor requirement, e.g. catecholamine requirement of said patient.

3. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to claim 1 or 2 wherein said ADM antibody or an adrenomedullin antibody
fragment or ADM non-IG scaffold is a non-neutralizing ADM antibody or a non-neutralizing adrenomedullin antibody fragment or a non-neutralizing ADM non-IG scaffold.

4. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 3 wherein the antibody format is selected from the group comprising Fv fragment, scFv fragment, Fab fragment, scFab fragment, (Fab)2 fragment and scFv-Fc Fusion protein.

5. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 4 wherein said antibody or fragment or scaffold binds to the N-terminal part (aa 1-21) of adrenomedullin.

6. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 5, wherein said antibody or fragment or scaffold recognizes and binds to the N-terminal end (aa1) of adrenomedullin.

7. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 6, wherein said antibody or fragment or scaffold is an ADM stabilizing antibody or fragment or scaffold that enhances the half life (t1/2 half retention time) of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably > 50 %, most preferably >100 %.

8. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 7, wherein said antibody or fragment or scaffold blocks the bioactivity of ADM to less than 80 %, preferably less than 50 %.

9. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 8, wherein said antibody or fragment or scaffold is a modulating ADM antibody or a modulating adrenomedullin antibody fragment or scaffold that enhances the half life (t1/2 half retention time) of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably > 50 %, most preferably >100 % and that blocks the bioactivity of ADM to less than 80 %, preferably less than 50 %:
10. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 9, wherein said antibody or fragment is a human monoclonal antibody or fragment that binds to ADM or an antibody fragment thereof wherein the heavy chain comprises the sequences

SEQ ID NO: 1

12. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease of a patient according to any of the claims 1 to 11 wherein said disease is selected from the group comprising SIRS, sepsis, diabetis, cancer, acute and chronic vascular diseases as e.g. heart failure, shock as e.g. septic shock and organ dysfunction as e.g. kidney dysfunction.

13. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease of a patient according to any of the claims 1 to 12 to be used in combination with catecholamine and/or fluids administered intravenously.
14. ADM antibody or adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease of a patient according to any of the claims 1 to 13 or a combination according to claim 10 to be used in combination with ADM binding protein and/or further active ingredients.

5

15. Pharmaceutical formulation comprising an antibody or fragment or non-IG scaffold according to any of claims 1 to 14.

16. Pharmaceutical formulation according to claim 15 wherein said pharmaceutical formulation is a solution, preferably a ready-to-use solution.

17. Pharmaceutical formulation according to claim 15 wherein said pharmaceutical formulation is in a freeze-dried state.

18. Pharmaceutical formulation according to any of claims 15 to 16, wherein said pharmaceutical formulation is administered intra-muscular.

19. Pharmaceutical formulation according to any of claims 14 to 16, wherein said pharmaceutical formulation is administered intra-vascular.

20. Pharmaceutical formulation according to claim 16, wherein said pharmaceutical formulation is administered via infusion.

Further embodiments within the scope of the present invention are set out below:

25

1. Adrenomedullin antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease wherein said antibody or said fragment is an ADM stabilizing antibody or fragment that enhances the t\textsubscript{1/2} half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably >50 %, most preferably 100 % and/or wherein said antibody blocks the bioactivity of ADM to less than 80 %, preferably to less than 50 %.
2. Adrenomedullin antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease wherein said antibody or said fragment is a modulating ADM antibody or fragment that enhances the t_{1/2} half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably >50 %, most preferably 100 % and that blocks the bioactivity of ADM to less than 80 %, preferably to less than 50 %.

3. Adrenomedullin antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease according to claim 1 or 2, wherein said antibody or fragment binds to the N-terminal part (aa 1-21) of adrenomedullin.

4. Adrenomedullin antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease wherein said antibody or said fragment according to claim 3 binds to the N-terminal end of adrenomedullin.

5. Adrenomedullin antibody or an adrenomedullin antibody fragment for use in a use in a treatment of a chronic or acute disease according to any of claims 1 to 4, wherein said antibody or said fragment is an ADM stabilizing antibody or fragment that enhances the t_{1/2} half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably >50 %, most preferably 100 %.

6. Adrenomedullin antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease according to any of claims 1 to 5, wherein said antibody or said fragment blocks the bioactivity of ADM to less than 80 %, preferably to less than 50 %.

7. Adrenomedullin antibody or an adrenomedullin antibody fragment according to any of the claims 1 to 6 for use in a treatment of a chronic or acute disease wherein said disease is selected from the group comprising SIRS, sepsis, septic shock, diabetis, cancer, heart failure, shock, organ failure, kidney dysfunction, acute liquid dysbalance, and low blood pressure.
8. Adrenomedullin antibody or an adrenomedullin antibody fragment according to any of the claims 1 to 7 for use in a treatment of a chronic or acute disease wherein said disease is septic shock or sepsis.

9. Adrenomedullin antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease according to any of the claims 1 to 8 wherein said antibody or fragment regulates the liquid balance of said patient.

10. Adrenomedullin antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease according to any of the claims 1 to 9 wherein said antibody or fragment used for prevention of organ dysfunction or organ failure.

11. Adrenomedullin antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease according to claim 10 wherein said antibody or fragment is used for prevention of kidney dysfunction or kidney failure.

12. Adrenomedullin (ADM) antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease in a patient according to claims 1 to 11 wherein said antibody or fragment is used for stabilizing the circulation.

13. ADM antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease in a patient according to claim 12 wherein said antibody or fragment reduces the catecholamine requirement of said patient.

14. ADM antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease in a patient according to any of claims 1 to 13 for the reduction of the mortality risk for said patient.

15. ADM antibody or an adrenomedullin antibody fragment for use in a treatment of a chronic or acute disease in a patient according to any of claims 1 to 14 wherein said antibody or fragment may be administered in a dose of at least 3 μg / Kg body weight.
16. Pharmaceutical composition comprising an antibody or fragment according to any of claims 1 to 15.

Further embodiments within the scope of the present invention are set out below:

1. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold wherein said antibody or said fragment or scaffold is a non-neutralizing antibody.

2. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold wherein said antibody or said fragment or scaffold is an ADM stabilizing antibody or fragment or scaffold that enhances the half life (t_{1/2} half retention time) of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least 50 %, more preferably >50 %, most preferably 100 % and/or wherein said antibody or fragment or scaffold blocks the bioactivity of ADM to less than 80 %, preferably to less than 50 %.

3. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold wherein said antibody or said fragment is a modulating ADM antibody or fragment or scaffold that enhances the half life (t_{1/2} half retention time) of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably >50 %, most preferably 100 % and that blocks the bioactivity of ADM to less than 80 %, preferably to less than 50 %.

4. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to claim 1 or 2, wherein said antibody or fragment or scaffold binds to the N-terminal part (aa 1-21) of adrenomedullin.

5. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold wherein said antibody or said fragment or scaffold according to claim 3 binds to the N-terminal end of adrenomedullin.
6. Adrenomedullin antibody or an adrenomedullin antibody fragment ADM non-Ig scaffold according to any of claims 1 to 4, wherein said antibody or said fragment or said scaffold is an ADM stabilizing antibody or fragment that enhances the $t_{1/2}$ half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably $>50$ %, most preferably 100 %.

7. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to any of the claims 1 to 6 for use as an active pharmaceutical substance.

8. Adrenomedullin antibody or an adrenomedullin antibody fragment ADM non-Ig scaffold according to any of the claims 1 to 7 for use in a treatment of a chronic or acute disease or acute condition wherein said disease or condition is selected from the group comprising severe infections as e.g. meningitis, systemic inflammatory Response-Syndrome (SIRS,) sepsis; other diseases as diabetes, cancer, acute and chronic vascular diseases as e.g. heart failure, myocardial infarction, stroke, atherosclerosis; shock as e.g. septic shock and organ dysfunction as e.g. kidney dysfunction, liver dysfunction, burnings, surgery, traumata.

9. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to any of the claims 1 to 8 for use in a treatment of a chronic or acute disease or acute condition wherein said disease is septic shock or sepsis.

10. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 9, wherein said antibody or fragment is a human monoclonal antibody or fragment that binds to ADM or an antibody fragment thereof wherein the heavy chain comprises at least one of the sequences:

SEQ ID NO: 1

GYTFSRYW
SEQ ID NO: 2

ILPGSGST

SEQ ID NO: 3

TEGYEYDGFDY

And/or wherein the light chain comprises the at least one of the sequences

SEQ ID NO: 4

SEQ ID NO: 13 (AM-VL1)
12. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to any of the claims 1 to 11 for regulating the fluid balance in a patient having a chronic or acute disease or acute condition.

13. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to any of the claims 1 to 11 for preventing or reducing organ dysfunction or organ failure in a patient having in a chronic or acute disease or acute condition.

14. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to claim 10 wherein organ is kidney or liver.

15. Adrenomedullin (ADM) antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to claims 1 to 14 for stabilizing the circulation in a patient having a chronic or acute disease or acute condition.

16. ADM antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold for use in a treatment of a chronic or acute disease in a patient according to claim 15 wherein said antibody or fragment reduces the catecholamine requirement of said patient.
17. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to any of the claims 1 to 16 to be used in combination with vasopressors e.g. catecholamine.

18. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to any of the claims 1 to 17 to be used in combination with intravenous fluid administration.

19. Adrenomedullin antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to any of the claims 1 to 18 to be used in combination with an TNF-alpha-antibody.

20. ADM antibody or an adrenomedullin antibody fragment or non-Ig-scaffold according to any of claims 1 to 19 for use in a treatment of a patient in need thereof wherein said antibody or fragment may be administered in a dose of at least 3 µg / Kg body weight.

21. Pharmaceutical composition comprising an antibody or fragment or scaffold according to any of claims 1 to 20.

22. ADM antibody or an adrenomedullin antibody fragment or non-Ig-scaffold according to any of claims 1 to 20 for use in a treatment of a chronic or acute disease or chronic condition.

23. ADM antibody or an adrenomedullin antibody fragment or non-Ig-scaffold according to claim 22 wherein said disease is sepsis.

Further embodiments within the scope of the present invention are set out below:

1. Adrenomedullin ADM antibody or an adrenomedullin antibody fragment for use in therapy of a severe chronic or acute disease of a patient for the reduction of the mortality risk for said patient.
2. ADM antibody or an adrenomedullin antibody fragment according to claim 1 wherein the antibody format is selected from the group comprising Fv fragment, scFv fragment, Fab fragment, scFab fragment, (Fab)2 fragment and scFv-Fc Fusion protein.

3. ADM antibody or an adrenomedullin antibody fragment according claim 1 or 2 wherein said antibody or fragment binds to the N-terminal part (aa 1-21) of adrenomedullin.

4. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 3, wherein said antibody or fragment recognizes and binds to the N-terminal end (aa1) of adrenomedullin.

5. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 4, wherein said antibody or fragment is an ADM stabilizing antibody or fragment that enhances the t1/2 half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably > 50 %, most preferably > 100 %.

6. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 5, wherein said antibody or fragment blocks the bioactivity of ADM to less than 80 %, preferably less than 50%.

7. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a chronical or acute disease of a patient according to any of claims 1 to 6 wherein said disease is selected from the group comprising sepsis, diabetis, cancer, heart failure, shock and kidney dysfunction.

8. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a chronical or acute disease of a patient according to any of claims 1 to 7 wherein said patient is an ICU patient.
9. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a
crchronical or acute disease of a patient according to any of claims 1 to 8 wherein the
mortality risk is reduced by preventing adverse event wherein the latter are selected
from the group comprising SIRS, sepsis, septic shock, organ failure, kidney failure,
liquid dysbalance and low blood pressure.

10. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a
crchronical or acute disease of a patient according to any of claims 1 to 8 wherein said
antibody or fragment is to be used in combination of ADM binding protein.

11. Pharmaceutical formulation comprising an antibody or fragment according to any of
claims 1 to 10.

12. Pharmaceutical formulation according to claim 11 wherein said pharmaceutical
formulation is a solution, preferably a ready-to-use solution.

13. Pharmaceutical formulation according to claim 11 wherein said pharmaceutical
formulation is in a freeze-dried state.

14. Pharmaceutical formulation according to any of claims 11 to 12, wherein said
pharmaceutical formulation is administered intra-muscular.

15. Pharmaceutical formulation according to any of claims 11 to 12, wherein said
pharmaceutical formulation is administered intra-vascular.

16. Pharmaceutical formulation according to claim 15, wherein said pharmaceutical
formulation is administered via infusion.

Further embodiments within the scope of the present invention are set out below:

1. Adrenomedullin (ADM) antibody or an adrenomedullin antibody fragment or ADM
non-Ig scaffold for use in therapy of a severe chronic or acute disease or acute
condition of a patient for the reduction of the mortality risk for said patient wherein
said antibody or fragment or scaffold is a non-neutralizing ADM antibody or a non-neutralizing adrenomedullin antibody fragment or a non-neutralizing ADM non-Ig scaffold.

2. ADM antibody or an adrenomedullin antibody fragment according to claim 1 wherein the antibody format is selected from the group comprising Fv fragment, scFv fragment, Fab fragment, scFab fragment, (Fab)2 fragment and scFv-Fe Fusion protein.

3. ADM antibody or an adrenomedullin antibody fragment or an ADM non-Ig scaffold according claim 1 or 2 wherein said antibody or fragment or scaffold binds to the N-terminal part (aa 1-21) of adrenomedullin.

4. ADM antibody or an adrenomedullin antibody fragment or an ADM non-Ig scaffold according to any of claims 1 to 3, wherein said antibody or fragment or scaffold recognizes and binds to the N-terminal end (aa1) of adrenomedullin.

5. ADM antibody or an adrenomedullin antibody fragment or an ADM non-Ig scaffold according to any of claims 1 to 4, wherein said antibody or fragment or scaffold is an ADM stabilizing antibody or fragment or scaffold that enhances the half life (t1/2 half retention time) of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least, 50 %, more preferably > 50 %, most preferably > 100 %.

6. ADM antibody or an adrenomedullin antibody fragment or an ADM non-Ig scaffold according to any of claims 1 to 5, wherein said antibody or fragment or scaffold blocks the bioactivity of ADM to less than 80 %, preferably less than 50%.

7. ADM antibody or an adrenomedullin antibody fragment or an ADM non-Ig scaffold for use in therapy of a chronical or acute disease of a patient according to any of claims 1 to 6 wherein said disease is selected from the group comprising severe infections as e.g. meningitis, Systemic inflammatory Response-Syndrom (SIRS,) sepsis; other diseases as diabetis, cancer, acute and chronic vascular diseases as e.g. heart failure, myocardial infarction, stroke, atherosclerosis; shock as e.g. septic shock and organ dysfunction as e.g. kidney dysfunction, liver dysfunction; burnings, surgery, traumata.
8. ADM antibody or an adrenomedullin antibody fragment or an ADM non-Ig scaffold for use in therapy of a chronic or acute disease of a patient according to any of claims 1 to 7 wherein said disease is selected from the group comprising SIRS, a severe infection, sepsis, shock e.g. septic shock.

9. ADM antibody or an adrenomedullin antibody fragment or an ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition of a patient according to any of claims 1 to 8 wherein said patient is an ICU patient. ADM antibody or an adrenomedullin antibody fragment or an ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition of a patient according to any of claims 1 to 9 wherein the mortality risk is reduced by preventing an adverse event wherein the latter are selected from the group comprising SIRS, sepsis, shock as e.g. septic shock, acute and chronic vascular diseases as e.g. acute heart failure, myocardial infarction, stroke; organ failure as e.g., kidney failure, liver failure, fluid dysbalance and low blood pressure.

10. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 9, wherein said antibody or fragment is a human monoclonal antibody or fragment that binds to ADM or an antibody fragment thereof wherein the heavy chain comprises the sequences

SEQ ID NO: 1

GYTFSRYW

SEQ ID NO: 2

13. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease of a patient according to any of the claims 1 to 12 to be used in combination with vasopressors e.g. catecholamine and/or fluids administered intravenously.

14. ADM antibody or adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease of a patient according to any of the claims 1 to 13 or a combination according to claim 10 to be used in combination with ADM binding protein and/or further active ingredients.

15. Pharmaceutical formulation comprising an antibody or fragment or scaffold according to any of claims 1 to 14.

16. Pharmaceutical formulation according to claim 15 wherein said pharmaceutical formulation is a solution, preferably a ready-to-use solution.

17. Pharmaceutical formulation according to claim 15 wherein said pharmaceutical formulation is in a freeze-dried state.

18. Pharmaceutical formulation according to any of claims 15 to 16, wherein said pharmaceutical formulation is administered intra-muscular.

19. Pharmaceutical formulation according to any of claims 15 to 16, wherein said pharmaceutical formulation is administered intra-vascular.

20. Pharmaceutical formulation according to claim 19, wherein said pharmaceutical formulation is administered via infusion.
21. ADM antibody or an Adrenomedullin antibody fragment or AM non-Ig scaffold, wherein said antibody or fragment or scaffold binds to the N-terminal part (aa 1-21) of Adrenomedullin in, preferably human ADM.

22. Antibody or fragment or scaffold according to claim 2, wherein said antibody or fragment or scaffold recognizes and binds to the N-terminal end (aa 1) of Adrenomedullin.

Further embodiments within the scope of the present invention are set out below:

1. Adrenomedullin (ADM) antibody or an adrenomedullin antibody fragment for use in therapy of a chronical or acute disease of a patient for prevention of organ dysfunction or organ failure.

2. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a chronical or acute disease according to claim 1 wherein said organ is kidney.

3. ADM antibody or an adrenomedullin antibody fragment according to claim 1 wherein the antibody format is selected from the group comprising Fv fragment, scFv fragment, Fab fragment, scFab fragment, (Fab)2 fragment and scFv-Fc Fusion protein.

4. ADM antibody or an adrenomedullin antibody fragment according any of claims 1 to 3 wherein said antibody or fragment binds to the N-terminal part (aa 1-21) of adrenomedullin.

5. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 4, wherein said antibody or fragment recognizes and binds to the N-terminal end (aa1) of adrenomedullin.
6. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 5, wherein said antibody or said fragment is an ADM stabilizing antibody or fragment that enhances the t1/2 half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least 50 %, more preferably >50 %, most preferably >100%.

7. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 6, wherein said antibody blocks the bioactivity of ADM to less than 80 %, preferably less than 50%.

8. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a chronic or acute disease of a patient according to any of claims 1 to 7 wherein said disease is selected from the group comprising sepsis, diabetis, cancer, heart failure, and shock.

9. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a chronic or acute disease of a patient according to any of claims 1 to 8 wherein said patient is an ICU patient.

10. ADM antibody or an adrenomedullin antibody fragment for use in therapy of a chronic or acute disease of a patient according to any of claims 1 to 9 wherein said antibody or fragment is a modulating antibody or fragment that enhances the t1/2 half retention time of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least 50 %, more preferably >50 %, most preferably >100% and that blocks the bioactivity of ADM to less than 80 %, preferably less than 50%.

11. Pharmaceutical formulation comprising an antibody or fragment according to any of claims 1 to 10.

12. Pharmaceutical formulation according to claim 11 wherein said pharmaceutical formulation is a solution, preferably a ready-to-use solution.
13. Pharmaceutical formulation according to claim 11 wherein said pharmaceutical formulation is in a freeze-dried state.

14. Pharmaceutical formulation according to any of claims 11 to 12, wherein said pharmaceutical formulation is administered intra-muscular.

15. Pharmaceutical formulation according to any of claims 11 to 12, wherein said pharmaceutical formulation is administered intra-vascular.

16. Pharmaceutical formulation according to claim 15, wherein said pharmaceutical formulation is administered via infusion.

Further embodiments within the scope of the present invention are set out below:

1. Adrenomedullin (ADM) antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute condition of a patient for prevention or reduction of organ dysfunction or prevention of organ failure in said patient.

2. ADM antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold for use in therapy of a chronic or acute disease or acute disease according to claim 1 wherein said organ is kidney or liver.

3. ADM antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to claim 1 or 2 wherein said ADM antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold is a non-neutralizing ADM antibody or a non-neutralizing adrenomedullin antibody fragment or a non-neutralizing ADM non-Ig scaffold.

4. ADM antibody or an adrenomedullin antibody fragment or ADM non-Ig scaffold according to any of claims 1 or 3 wherein the antibody format is selected from the group comprising Fv fragment, scFv fragment, Fab fragment, scFab fragment, (Fab)2 fragment and scFv-Fe Fusion protein.
5. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according any of claims 1 to 4 wherein said antibody or fragment or scaffold binds to the N-terminal part (aa 1-21) of adrenomedullin.

6. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 5, wherein said antibody or fragment or scaffold recognizes and binds to the N-terminal end (aa1) of adrenomedullin.

7. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 6, wherein said antibody or said fragment or scaffold is an ADM stabilizing antibody or fragment or scaffold that enhances the half life (t1/2 half retention time) of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least 50 %, more preferably >50 %, most preferably >100%.

8. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold according to any of claims 1 to 7, wherein said antibody or fragment or scaffold blocks the bioactivity of ADM to less than 80 %, preferably less than 50%.

9. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronical or acute disease or acute condition of a patient according to any of claims 1 to 8 wherein said disease is selected from the group comprising sepsis, diabetis, cancer, heart failure, and shock.

10. ADM antibody or an adrenomedullin antibody fragment according to any of claims 1 to 9, wherein said antibody or fragment is a human monoclonal antibody or fragment that binds to ADM or an antibody fragment thereof wherein the heavy chain comprises the sequences

SEQ ID NO: 1

VDKRVEPKHHHHHH

SEQ ID NO: 8 (AM-VH1)
12. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease of a patient according to any of claims 1 to 11 wherein said antibody or fragment or scaffold is a modulating antibody or fragment or scaffold that enhances the half life (t1/2 half retention time) of adrenomedullin in serum, blood, plasma at least 10%, preferably at least 50%, more preferably >50%, most preferably >100% and that blocks the bioactivity of ADM to less than 80%, preferably less than 50%.

13. ADM antibody or an adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease or acute condition of a patient according to any of the claims 1 to 12 to be used in combination with vasopressors e.g. catecholamine and/or fluids administered intravenously.

14. ADM antibody or adrenomedullin antibody fragment or ADM non-IG scaffold for use in therapy of a chronic or acute disease or acute condition of a patient according to any of the claims 1 to 13 or a combination according to claim 13 to be used in combination with ADM binding protein and/or further active ingredients.

15. Pharmaceutical formulation comprising an antibody or fragment according to any of claims 1 to 13.
16. Pharmaceutical formulation according to claim 14 wherein said pharmaceutical formulation is a solution, preferably a ready-to-use solution.

17. Pharmaceutical formulation according to claim 14 wherein said pharmaceutical formulation is in a freeze-dried state.

18. Pharmaceutical formulation according to any of claims 14 to 15, wherein said pharmaceutical formulation is administered intra-muscular.

19. Pharmaceutical formulation according to any of claims 14 to 15, wherein said pharmaceutical formulation is administered intra-vascular.

20. Pharmaceutical formulation according to claim 18, wherein said pharmaceutical formulation is administered via infusion.
EXAMPLES

It should be emphasized that the antibodies, antibody fragments and non-Ig scaffolds of the example portion in accordance with the invention are binding to ADM, and thus should be considered as anti-ADM antibodies/antibody fragments/non-Ig scaffolds.

Example 1

Generation of Antibodies and determination of their affinity constants

Several human and murine antibodies were produced and their affinity constants were determined (see tables 1 and 2).

Peptides/conjugates for Immunization:

Peptides for immunization were synthesized, see Table 1, (JPT Technologies, Berlin, Germany) with an additional N-terminal Cystein (if no Cystein is present within the selected ADM-sequence) residue for conjugation of the peptides to Bovine Serum Albumin (BSA). The peptides were covalently linked to BSA by using Sulfolink-coupling gel (Perbio-science, Bonn, Germany). The coupling procedure was performed according to the manual of Perbio.

The murine antibodies were generated according to the following method:
A Balb/c mouse was immunized with 100μg Peptide-BSA-Conjugate at day 0 and 14 (emulsified in 100μl complete Freund’s adjuvant) and 50μg at day 21 and 28 (in 100μl incomplete Freund’s adjuvant). Three days before the fusion experiment was performed, the animal received 50μg of the conjugate dissolved in 100μl saline, given as one intraperitoneal and one intra-venous injection.

Splenocytes from the immunized mouse and cells of the myeloma cell line SP2/0 were fused with 1ml 50% polyethylene glycol for 30s at 37°C. After washing, the cells were seeded in 96-well cell culture plates. Hybrid clones were selected by growing in HAT medium [RPMI 1640 culture medium supplemented with 20% fetal calf serum and HAT-Supplement]. After two weeks the HAT medium is replaced with HT Medium for three passages followed by returning to the normal cell culture medium.
The cell culture supernatants were primary screened for antigen specific IgG antibodies three weeks after fusion. The positive tested microcultures were transferred into 24-well plates for propagation. After retesting, the selected cultures were cloned and recloned using the limiting-dilution technique and the isotypes were determined.

**Mouse monoclonal antibody production:**

Antibodies were produced via standard antibody production methods (Marx et al, Monoclonal Antibody Production, ATLA 25, 121, 1997,) and purified via Protein A. The antibody purities were > 95% based on SDS gel electrophoresis analysis.

**Human Antibodies**

Human Antibodies were produced by means of phage display according to the following procedure:

The human naive antibody gene libraries HAL7/8 were used for the isolation of recombinant single chain F-Variable domains (scFv) against adrenomedullin peptide. The antibody gene libraries were screened with a panning strategy comprising the use of peptides containing a biotin tag linked via two different spacers to the adrenomedullin peptide sequence. A mix of panning rounds using non-specifically bound antigen and streptavidin bound antigen were used to minimize background of non-specific binders. The eluted phages from the third round of panning have been used for the generation of monoclonal scFv expressing E.coli strains. Supernatant from the cultivation of these clonal strains has been directly used for an antigen ELISA testing (see also Hust, M., Meyer, T., Voedisch, B., Rülker, T., Thie, H., El-Ghezal, A., Kirsch, M.I., Schütte, M., Helmsing, S., Meier, D., Schirrmann, T., Dübel, S., 2011. A human scFv antibody generation pipeline for proteome research. Journal of Biotechnology 152, 159-170; Schütte, M., Thullier, P., Pelat, T., Wezler, X., Rosenstock, P., Hinz, D., Kirsch, M.I.,Hasenberg, M., Frank, R., Schirrmann, T., Gunzer, M., Hust, M., Dübel, S., 2009. Identification of a putative Crf splice variant and generation of recombinant antibodies for the specific detection of Aspergillus fumigatus. PLoS One 4, e6625).
Positive clones have been selected based on positive ELISA signal for antigen and negative for streptavidin coated micro titer plates. For further characterizations the scFv open reading frame has been cloned into the expression plasmid pOPE107 (Hust et al., J. Biotechn. 2011), captured from the culture supernatant via immobilised metal ion affinity chromatography and purified by a size exclusion chromatography.

**Affinity Constants**

To determine the affinity of the antibodies to Adrenomedullin, the kinetics of binding of Adrenomedullin to immobilized antibody was determined by means of label-free surface plasmon resonance using a Biacore 2000 system (GE Healthcare Europe GmbH, Freiburg, Germany). Reversible immobilization of the antibodies was performed using an anti-mouse Fc antibody covalently coupled in high density to a CM5 sensor surface according to the manufacturer's instructions (mouse antibody capture kit; GE Healthcare). (Lorenz et al.,“Functional Antibodies Targeting IsaA of Staphylococcus aureus Augment Host Immune Response and Open New Perspectives for Antibacterial Therapy“; Antimicrob Agents Chemother. 2011 January; 55(1): 165–173.)

The monoclonal antibodies were raised against the below depicted ADM regions of human and murine ADM, respectively. The following table represents a selection of obtained antibodies used in further experiments. Selection was based on target region:

**Generation of antibody fragments by enzymatic digestion:**

The generation of Fab and F(ab)₂ fragments was done by enzymatic digestion of the murine full length antibody NT-M. Antibody NT-M was digested using a) the pepsin-based F(ab)₂ Preparation Kit (Pierce 44988) and b) the papain-based Fab Preparation Kit (Pierce 44985). The fragmentation procedures were performed according to the instructions provided by the supplier. Digestion was carried out in case of F(ab)₂-fragmentation for 8h at 37°C. The Fab-fragmentation digestion was carried out for 16h, respectively.

**Procedure for Fab Generation and Purification:**
The immobilized papain was equilibrated by washing the resin with 0.5 ml of Digestion Buffer and centrifuging the column at 5000 x g for 1 minute. The buffer was discarded afterwards. The desalting column was prepared by removing the storage solution and washing it with digestion buffer, centrifuging it each time afterwards at 1000 x g for 2 minutes. 0.5ml of the prepared IgG sample where added to the spin column tube containing the equilibrated Immobilized Papain. Incubation time of the digestion reaction was done for 16h on a tabletop rocker at 37°C. The column was centrifuged at 5000 x g for 1 minute to separate digest from the Immobilized Papain. Afterwards the resin was washed with 0.5ml PBS and centrifuged at 5000 x g for 1 minute. The wash fraction was added to the digested antibody that the total sample volume was 1.0ml. The NAb Protein A Column was equilibrated with PBS and IgG Elution Buffer at room temperature. The column was centrifuged for 1 minute to remove storage solution (contains 0.02% sodium azide) and equilibrated by adding 2ml of PBS, centrifuge again for 1 minute and the flow-through discarded. The sample was applied to the column and resuspended by inversion. Incubation was done at room temperature with end-over-end mixing for 10 minutes. The column was centrifuged for 1 minute, saving the flow-through with the Fab fragments.

Procedure for generation and purification of F(ab')2 Fragments:

The immobilized Pepsin was equilibrated by washing the resin with 0.5 ml of Digestion Buffer and centrifuging the column at 5000 x g for 1 minute. The buffer was discarded afterwards. The desalting column was prepared by removing the storage solution and washing
it with digestion buffer, centrifuging it each time afterwards at 1000 x g for 2 minutes. 0.5ml
of the prepared IgG sample where added to the spin column tube containing the equilibrated
Immobilized Pepsin. Incubation time of the digestion reaction was done for 16h on a tabletop
rocker at 37°C. The column was centrifuged at 5000 × g for 1 minute to separate digest from
the Immobilized Papain. Afterwards the resin was washed with 0.5mL PBS and centrifuged at
5000 × g for 1 minute. The wash fraction was added to the digested antibody that the total
sample volume was 1.0ml. The NAb Protein A Column was equilibrated with PBS and IgG
Elution Buffer at room temperature. The column was centrifuged for 1 minute to remove
storage solution (contains 0.02% sodium azide) and equilibrated by adding 2mL of PBS,
centrifuge again for 1 minute and the flow-through discarded. The sample was applied to the
column and resuspended by inversion. Incubation was done at room temperature with end-
over-end mixing for 10 minutes. The column was centrifuged for 1 minute, saving the flow-
through with the Fab fragments.

NT-H-Antibody Fragment Humanization

The following steps were done to achieve the humanized sequence:

Total RNA extraction: Total RNA was extracted from NT-H hybridomas using the Qiagen kit.

First-round RT-PCR: QIAGEN® OneStep RT-PCR Kit (Cat No. 210210) was used. RT-PCR was performed with primer sets specific for the heavy and light chains. For each RNA sample, 12 individual heavy chain and 11 light chain RT-PCR reactions were set up using degenerate forward primer mixtures covering the leader sequences of variable regions. Reverse primers are located in the constant regions of heavy and light chains. No restriction sites were engineered into the primers.

Reaction Setup: 5x QIAGEN® OneStep RT-PCR Buffer 5.0 µl, dNTP Mix (containing 10 mM of each dNTP) 0.8 µl, Primer set 0.5 µl, QIAGEN® OneStep RT-PCR Enzyme Mix 0.8 µl, Template RNA 2.0 µl, RNase-free water to 20.0 µl, Total volume 20.0 µl

PCR condition: Reverse transcription: 50°C, 30 min; Initial PCR activation: 95°C, 15 min

Cycling: 20 cycles of 94°C, 25 sec; 54°C, 30 sec; 72°C, 30 sec; Final extension: 72°C, 10 min

Second-round semi-nested PCR: The RT-PCR products from the first-round reactions were further amplified in the second-round PCR. 12 individual heavy chain and 11 light chain RT-PCR reactions were set up using semi-nested primer sets specific for antibody variable regions.

Reaction Setup: 2x PCR mix 10 µl; Primer set 2 µl; First-round PCR product 8 µl; Total volume 20 µl; Hybridoma Antibody Cloning Report

PCR condition: Initial denaturing of 5 min at 95°C; 25 cycles of 95°C for 25 sec, 57°C for 30 sec, 68°C for 30 sec; Final extension is 10 min 68°C.
After PCR is finished, run PCR reaction samples onto agarose gel to visualize DNA fragments amplified. After sequencing more than 15 cloned DNA fragments amplified by nested RT-PCR, several mouse antibody heavy and light chains have been cloned and appear correct. Protein sequence alignment and CDR analysis identifies one heavy chain and one light chain. After alignment with homologous human framework sequences the resulting humanized sequence for the variable heavy chain is the following: see figure 6 (As the amino acids on positions 26, 40 and 55 in the variable heavy chain and amino acid on position 40 in the variable light are critical to the binding properties, they may be reverted to the murine original. The resulting candidates are depicted below) (Padlan, E. A. (1991) A possible procedure for reducing the immunogenicity of antibody variable domains while preserving their ligand-binding properties. Mol. Immunol. 28, 489-498.; Harris, L. and Bajorath, J. (1995) Profiles for the analysis of immunoglobulin sequences: Comparison of V gene subgroups. Protein Sci. 4, 306-310.).

Annotation for the antibody fragment sequences (SEQ ID NO: 7-14): bold and underline are the CDR 1, 2, 3 in chronologically arranged; italic are constant regions; hinge regions are highlighted with bold letters and the histidine tag with bold and italic letters; framework point mutation have a grey letter-background.

Example 2

Effect of selected anti-ADM-antibodies on anti-ADM-bioactivity

The effect of selected ADM-antibodies on ADM-bioactivity was tested in an human recombinant Adrenomedullin receptor cAMP functional assay (Adrenomedullin Bioassay).

Testing of antibodies targeting human or mouse adrenomedullin in human recombinant Adrenomedullin receptor cAMP functional assay (Adrenomedullin Bioassay)
Materials:
Cell line: CHO-K1
Receptor: Adrenomedullin (CRLR + RAMP3)
Receptor Accession Number Cell line: CRLR: U17473; RAMP3: AJ001016

CHO-K1 cells expressing human recombinant adrenomedullin receptor (FAST-027C) grown prior to the test in media without antibiotic were detached by gentle flushing with PBS-EDTA (5 mM EDTA), recovered by centrifugation and resuspended in assay buffer (KRH: 5 mM KCl, 1.25 mM MgSO4, 124 mM NaCl, 25 mM HEPES, 13.3 mM Glucose, 1.25 mM KH2PO4, 1.45 mM CaCl2, 0.5 g/l BSA).

Dose response curves were performed in parallel with the reference agonists (hADM or mADM).

Antagonist test (96well):
For antagonist testing, 6 µl of the reference agonist (human (5,63nM) or mouse (0,67nM) adrenomedullin) was mixed with 6 µl of the test samples at different antagonist dilutions; or with 6 µl buffer. After incubation for 60 min at room temperature, 12 µl of cells (2,500 cells/well) were added. The plates were incubated for 30 min at room temperature. After addition of the lysis buffer, percentage of DeltaF will be estimated, according to the manufacturer specification, with the HTRF kit from Cis-Bio International (cat no62AM2 PEB). hADM 22-52 was used as reference antagonist.

Antibodies testing cAMP-HTRF assay

The anti-h-ADM antibodies (NT-H, MR-H, CT-H) were tested for antagonist activity in human recombinant adrenomedullin receptor (FAST-027C) cAMP functional assay in the presence of 5.63nM Human ADM 1-52, at the following final antibody concentrations: 100µg/ml, 20µg/ml, 4µg/ml, 0.8µg/ml, 0.16µg/ml.

The anti-m-ADM antibodies (NT-M, MR-M, CT-M) were tested for antagonist activity in human recombinant adrenomedullin receptor (FAST-027C) cAMP functional assay in the presence of 0.67nM Mouse ADM 1-50, at the following final antibody concentrations: 100µg/ml, 20µg/ml, 4µg/ml, 0.8µg/ml, 0.16µg/ml. Data were plotted relative inhibition vs. antagonist concentration (see figs. 3a to 3l). The maximal inhibition by the individual antibody is given in table 3.

Example 3

Data for stabilization of hADM by the anti-ADM antibody

The stabilizing effect of human ADM by human ADM antibodies was tested using a hADM immunoassay.

Immunooassay for the quantification of human Adrenomedullin

The technology used was a sandwich coated tube luminescence immunoassay, based on Acridinium ester labelling.

Labelled compound (tracer): 100μg (100μl) CT-H (1mg/ ml in PBS, pH 7.4, AdrenoMed AG, Germany) was mixed with 10μl Acradinium NHS-ester (1mg/ ml in acetonitrile, InVent GmbH, Germany) (EP 0353971) and incubated for 20min at room temperature. Labelled CT-H was purified by Gel-filtration HPLC on Bio-Sil® SEC 400-5 (Bio-Rad Laboratories, Inc., USA) The purified CT-H was diluted in (300 mmol/L potassiumphosphate, 100 mmol/L NaCl, 10 mmol/L Na-EDTA, 5 g/L Bovine Serum Albumin, pH 7.0). The final concentration was approx. 800.000 relative light units (RLU) of labelled compound (approx. 20ng labeled antibody) per 200 μL. Acridiniumester chemiluminescence was measured by using an AutoLumat LB 953 (Berthold Technologies GmbH & Co. KG).
Solid phase: Polystyrene tubes (Greiner Bio-One International AG, Austria) were coated (18h at room temperature) with MR-H (AdrenoMed AG, Germany) (1.5 µg MR-H/0.3 mL 100 mmol/L NaCl, 50 mmol/L TRIS/HCl, pH 7.8). After blocking with 5% bovine serum albumine, the tubes were washed with PBS, pH 7.4 and vacuum dried.

Calibration:

The assay was calibrated, using dilutions of hADM (BACHEM AG, Switzerland) in 250 mmol/L NaCl, 2 g/L Triton X-100, 50 g/L Bovine Serum Albumin, 20 tabs/L Protease Inhibitor Cocktail (Roche Diagnostics AG, Switzerland))

hADM Immunoassay:

50 µL of sample (or calibrator) was pipetted into coated tubes, after adding labeled CT-H (200µL), the tubes were incubated for 4h at 4°C. Unbound tracer was removed by washing 5 times (each 1ml) with washing solution (20mM PBS, pH 7.4, 0.1 % Triton X-100).

Tube-bound chemiluminescence was measured by using the LB 953

Figure 4 shows a typical hADM dose/signal curve. And an hADM dose signal curve in the presence of 100 µg/mL antibody NT-H. NT-H did not affect the described hADM immunoassay.

Stability of human Adrenomedullin:

Human ADM was diluted in human Citrate plasma (final concentration 10nM) and incubated at 24 °C. At selected time points, the degradation of hADM was stopped by freezing at -20 °C. The incubation was performed in absence and presence of NT-H (100µg/ml). The remaining hADM was quantified by using the hADM immunoassay described above.

Figure 5 shows the stability of hADM in human plasma (citrate) in absence and in the presence of NT-H antibody. The half life of hADM alone was 7,8h and in the presence of NT-H, the half life was 18,3h. (2.3 times higher stability).
Example 4

**Sepsis Mortality (early treatment)**

5 Animal model

12-15 week old male C57Bl/6 mice (Charles River Laboratories, Germany) were used for the study. Peritonitis had been surgically induced under light isoflurane anesthesia. Incisions were made into the left upper quadrant of the peritoneal cavity (normal location of the cecum). The cecum was exposed and a tight ligature was placed around the cecum with sutures distal to the insertion of the small bowel. One puncture wound was made with a 24-gauge needle into the cecum and small amounts of cecal contents were expressed through the wound. The cecum was replaced into the peritoneal cavity and the laparotomy site was closed. Finally, animals were returned to their cages with free access to food and water. 500μl saline were given s.c. as fluid replacement.

**Application and dosage of the compound (NT-M, MR-M, CT-M)**

Mice were treated immediately after CLP (early treatment). CLP is the abbreviation for cecal ligation and puncture (CLP).

**Study groups**

Three compounds were tested versus: vehicle and versus control compound treatment. Each group contained 5 mice for blood drawing after 1 day for BUN (serum blood urea nitrogen test) determination. Ten further mice per each group were followed over a period of 4 days.

Group Treatment (10μl/ g bodyweight) dose/ Follow-Up:

1 NT-M, 0.2 mg/ml survival over 4 days
2 MR-M, 0.2 mg/ml survival over 4 days
3 CT-M, 0.2 mg/ml survival over 4 days
4 non-specific mouse IgG, 0.2 mg/ml survival over 4 days
5 control - PBS 10μl/g bodyweight survival over 4 days

**Clinical chemistry**
Blood urea nitrogen (BUN) concentrations for renal function were measured baseline and day 1 after CLP. Blood samples were obtained from the cavernous sinus with a capillary under light ether anaesthesia. Measurements were performed by using an AU 400 Olympus Multianalyser. The 4-day mortality is given in table 4. The average BUN concentrations are given in table 5.

### Table 4:

<table>
<thead>

<td>MR-M</td>
<td>8.1</td>
<td>24.9</td>
</tr>
<tr>
<td>NT-M</td>
<td>8.8</td>
<td>8.2</td>
</tr>
</tbody>
</table>

It can be seen from Table 4 that the NT-M antibody reduced mortality considerably. After 4 days 70% of the mice survived when treated with NT-M antibody. When treated with MR-M antibody 30% of the animals survived and when treated with CT-M antibody 10% of the animals survived after 4 days. In contrast thereto all mice were dead after 4 days when treated with unspecific mouse IgG. The same result was obtained in the control group where PBS (phosphate buffered saline) was administered to mice.

The blood urea nitrogen or BUN test is used to evaluate kidney function, to help diagnose kidney disease, and to monitor patients with acute or chronic kidney dysfunction or failure. The results of the S-BUN Test revealed that the NT-M antibody was the most effective to protect the kidney.

**Sepsis Mortality (late treatment)**
Animal model

12-15 week old male C57Bl/6 mice (Charles River Laboratories, Germany) were used for the study. Peritonitis had been surgically induced under light isoflurane anesthesia. Incisions were made into the left upper quadrant of the peritoneal cavity (normal location of the cecum). The cecum was exposed and a tight ligature was placed around the cecum with sutures distal to the insertion of the small bowel. One puncture wound was made with a 24-gauge needle into the cecum and small amounts of cecal contents were expressed through the wound. The cecum was replaced into the peritoneal cavity and the laparotomy site was closed. Finally, animals were returned to their cages with free access to food and water. 500μl saline were given s.c. as fluid replacement.

Application and dosage of the compound (NT-M FAB2)

NT-M FAB2 was tested versus: vehicle and versus control compound treatment. Treatment was performed after full development of sepsis, 6 hours after CLP (late treatment). Each group contained 4 mice and were followed over a period of 4 days.

Group Treatment (10μl/ g bodyweight) dose/ Follow-Up:

Study groups

1 NT-M, FAB2 0.2 mg/ml survival over 4 days
2 control : non-specific mouse IgG, 0.2 mg/ml survival over 4 days
3 vehicle: - PBS 10μl/g bodyweight survival over 4 days

Table 6:

<table>
<thead>
<tr>

</tr>
<tr>
<td>Non-specific mouse IgG</td>
<td>0</td>
</tr>
<tr>
<td>NT-M FAB2</td>
<td>75</td>
</tr>
</tbody>
</table>

It can be seen from Table 6 that the NT-M FAB 2 antibody reduced mortality considerably. After 4 days 75 % of the mice survived when treated with NT-M FAB 2 antibody. In contrast thereto all mice were dead after 4 days when treated with non-specific mouse IgG. The same
result was obtained in the control group where PBS (phosphate buffered saline) was administered to mice.

Example 5

Incremental effect of anti-ADM antibody in CLP-animals on top of antibiotic treatment and circulation stabilization via catecholamines as well as regulation of fluid balance.

Animal model

After weighing, mice were anesthetized by intraperitoneal injection of 120 μg/g Ketamin, 1.25 μg/g Midazolam and 0.25 μg/g Fentanyl. During the surgical procedure, body temperature was kept at 37-38°C. A 1cm midline abdominal section was performed to get access to the cecum. The cecum then was ligated with 3-0 silk tie close to the basis and a single puncture with a 18-gauge needle was applied. The cecum was returned and the incision was closed again (4-0 tie). For the compensation of perioperative loss of liquids, 0.5 ml lactated Ringer’s solution with 1μg/g Buprenorphin as analgetic was injected subcutaneously in dorsal
dermis. For antibiotic the mice received Ceftriaxone 30μg/g and Clindamycin 30μg/g subcutaneously via the lower extremities.

After CLP surgery the animal were kept in an adequately heated environment with water and food ad libitum.

The covering of liquid requirements were ensured by a dorsal subcutaneous injections with 0.5 ml lactated ringer’s solution with 4 μg/g glucose and Buprenorphin 1μg/g, which were applied in an 8 hour cycle, after short term anesthesia by isoflurane. In addition, antibiotic was maintained by subcutaneous injections of Ceftriaxone 30μg/g and Clindamycin 30μg/g via the lower extremities.

Dosing of test substances

Early treatment

Immediately after the CLP surgery and closing of the incision, the test substance antibody NT-M was applied in a concentration of 500 μg/ml in phosphate buffered saline (PBS) via injection into the penis vein for a dose of 2mg per kg body weight (dose volume 88-120 μl) (5 animals).

Late treatment

After full Sepsis development, 15.5h after CLP surgery, animals were anesthetized as described above and NT-M was applied in a concentration of 500 μg/ml in phosphate buffered saline (PBS) via injection into the penis vein for a dose of 2mg per kg body weight (dose volume 88-120 μl) (3 animals).

The control group (6 animals) received a corresponding amount of the vehicle PBS solution without antibody (4μl/g, 88-120 μl) immediately after CLP surgery.

Study groups and experimental setting

Murine septic shock model under intensive care monitoring:
Three groups with 3, 5 and 6 animals were monitored. Group 1 (5 animals) received the antibody NT-M 15.5h after CLP, group 2 received the antibody NT-M immediately after CLP surgery and group 3 received a comparable amount of PBS (4μl/g). 16 hour incubation post CLP (to allow the polymicrobial sepsis to progress), the experiment was continued with monitoring and interventions comparable to an intensive medical care regime. Therefore, after weighing the animals were anesthetized as described in the CLP surgery part (except the late treated animals, which were anesthetized before treatment). Body temperature was maintained at 37-38°C for the rest of the experiment. After a tracheotomy and intubation, respiration was monitored and supported by laboratory animal lung ventilator Flexivent®, (Emka Technologies, FiO2 0.5, PEEP 10 H2O, VT 8μl/g, I:E 1:1.5, AF 70-140 depending on temperature).

Anesthesia was maintained throughout the experiment via the cannulated vena jugularis externa dextra with a continuous infusion of Ketamin 30 μg/gxh and Fentanyl 0.3 μg/gxh. Furthermore, the right aorta carotis communis was cannulated for continuous monitoring of heart rate and the mean arterial pressure (MAP). The mean arterial pressure was maintained at MAP > 65 mmHg via intravenous (V. jugularis) infusion of colloids (80 μL/gxh, Hextend®) and, if needed, Noradrenalin dissolved in colloids as vasopressor. Blood samples (120 μl) were taken via the cannulated A. carotis at 0 and 4 hours for determination of creatinine. The bladder was punctured and urine was collected via a bladder catheter. The experiment was either terminated after 6 hours or prior to this, if the MAP > 65 mmHg (V. jugularis) could not be maintained with the vasopressor dosing.

**Measured parameters**

The following parameters were measured and analyzed: Total consumption of noradrenaline (μg NA/g), consumption rate of noradrenaline (μg NA/g/h), total volume of urine collected during the experiment, creatinine concentration (μg/mL) at the end of the experiment and mean creatinine clearance (μL/min).

**Table 7:**

<p>|                         | Total consumption of Noradrenaline (μg NA/g) (Average) | consumption rate of Noradrenaline (μg NA/g/h) (Average) |</p>

</table>

The catecholamine requirement was measured after administration of either non specific mouse IgG to a total of 6 mice as control group, NT-murine antibody to a group of 5 mice immediately after CLP (early treatment) or NT-murine antibody to a group of 3 mice 15.5h after CLP (late treatment).

The reduction of the catecholamine requirement is a measure for the stabilization of the circulation. Thus, the data show that the ADM antibody, especially the NT-M antibody, leads to a considerable stabilization of the circulation and to a considerable reduction of the catecholamine requirement. The circulation-stabilizing effect was given in early treatment (immediately after CLP) and treatment after full sepsis development (late treatment) (see fig. 7).

**Regulation of Fluid Balance**

More positive fluid balance both early in resuscitation and cumulatively over 4 days is associated with an increased risk of mortality in septic shock. The control of the liquid balance is of utmost importance for the course of disease of patients having sepsis. (s. Boyd *et al*, 2011). Controlling the liquid balance of critical ill patients remains as a substantial challenge in intensive care medicine. As can be seen in table 8 treatment of mice after CLP (experimental procedures see “Animal Model”) with NT-M antibody lead to an enhancement of the total volume of urine excreted. The urine secreted was approx. three times higher in NT-M-treated animals compared to non-treated mice. The positive treatment effect was given in early- and in late treatment. The fluid balance was improved by about 20-30%, also in both, early and late treatment. Thus, the data show that the use of ADM antibody, especially the use of NT ADM antibody, is favorable for regulating the fluid balance in patients. (see table 8 and figures 8 and 9).

**Improvement of kidney function**

The combination of acute renal failure and sepsis is associated with a 70 percent mortality, as compared with a 45 percent mortality among patients with acute renal failure alone. (Schrier and Wang, “Mechanisms of Disease Acute Renal Failure and Sepsis”; The New England Journal of Medicine; 351:159-69; 2004). Creatinine concentration and creatinine clearance are standard laboratory parameters for monitoring kidney (dys)function (Jacob, “Acute Renal Failure”, Indian J. Anaesth.; 47 (5): 367-372; 2003). Creatinine and creatinine clearance data from above described animal experiment (early treatment) are given in Table 9.

Table 9

</tbody>
</table>
In comparison to control septic animals, the creatinine concentration was lowered by 42% and the creatinine clearance was improved by more than 100% as a result of NT-M treatment (Table 9). The data show that the administration of ADM-antibody, especially NT-M, leads to an improvement of kidney function.

**Improvement of liver inflammatory status**

Liver tissue for control and early treated animals was homogenized and lysed in lysing buffer. For cell extract preparation, cells were resuspended, lysed on ice, and centrifuged. The supernatant (protein extract) was stored at -80 °C. Activation of nuclear factor kappa-light-chain gene enhancer in B cells (NF-κB) was determined as previously described using an electrophoretic mobility shift assay (EMSA) 1.2. Cell extracts (10μg) were incubated on ice with poly-doxo-inosinic-deoxy-cytidylid acid (poly-dl-dC) and 32P-labeled double stranded oligonucleotide (Biomers, Ulm, Germany) containing the NF-κB (HIV κsites) ( 5'-GGATCCTCAACAGAGGGGACTTTCCCGAGGCCA-3'). Complexes were separated in native polyacrylamide gels, dried and exposed to X-ray films. A phosphorimager and image analyzer software (AIDA Image Analyzer; Raytest) was used to quantify the radioactively labeled NF-κB by densitometry. For comparison between individual gels, the intensity of each band was related to that of simultaneously loaded control animals which had not undergone surgical instrumentation and CLP. Therefore, the EMSA data are expressed as fold increase over control values. Statistics: All data are presented as median (range) unless otherwise stated differences between the two groups were analyzed with the Mann-Whitney rank sum test for unpaired samples. Results: The animals treated with NT-M presented with significantly attenuated liver tissue NF-κB activation (2.27 (1.97-2.53)) compared to vehicle animals (2.92 (2.50-3.81)) (p<0.001) (see figure 10).

**References:**

Example 6

In vivo side effect determination of antibody NT-M

12-15 week old male C57Bl/6 mice (Charles River Laboratories, Germany) were used for the study. 6 mice were treated with (10μl/ g bodyweight) dose of NT-M, 0.2 mg/ml. As control, 6 mice were treated with (10μl/g body weight) PBS. Survival and physical condition was monitored for 14 days. The mortality was 0 in both groups, there were no differences in physical condition between NT-M and control group.

Example 7

Gentamicin-induced nephrotoxicity

A non-septic acute kidney injury model has been established, which makes use of the nephrotoxicity induced by Gentamicin (Chiu PJS. Models uscd to assess renal functions. Drug Develop Res 32:247-255, 1994.). This model was used to assess whether treatment with anti-Adrenomedullin antibody can improve kidney function.

The experiment was performed as follows:

| Study Design: Effect of a NT-M on Gentamicin-Induced Nephrotoxicity in Rats |
|---------------------------------|-----|-----|-----|-----|
| **Group** | **Test** | **Conc** | **Dosage** | **Rats** |
| 1 | Gentamicin<sup>a</sup> + vehicle<sup>b</sup> | IV | NA x 4<sup>c</sup> | 8 |
| 2 | Gentamicin<sup>a</sup> + NT-M | IV | X 4<sup>c</sup> | 8 |

<sup>a</sup>Gentamicin at 120 mg/kg intramuscularly for 7 days (days 0-6).
Groups of 8 male Sprague-Dawley rats weighing 250 ± 20 g were employed. Animals were challenged with gentamicin at 120 mg/kg i.m. for seven consecutive days (Groups 1 and 2). Test compound (anti-adrenomedullin antibody NT-M) and vehicle (phosphate buffered saline) were injected intravenously 5 min before gentamicin on day 0, followed by injection on days 2, 4, and 6. Body weights and clinical signs were monitored daily. Twenty-four (24) hour urine collections on ice were performed on Days 0, 2, and 6. Urine specimens were assayed for concentrations of Na⁺ and K⁺, and creatinine. Blood samples for clinical chemistry were collected on Days 1 (before gentamicin), 3 (before gentamicin), and 7. Serum electrolytes (Na⁺ and K⁺), creatinine, and BUN were the primary analytes that were monitored for assessing renal function. Plasma samples were collected in EDTA tubes (Days 1 and 3: 100 μl; Day 7: 120 μl). Creatinine clearance was calculated. Urine volume, urinary electrolytes, and creatinine are expressed as amount excreted per 100 g of animal body weight. All animals were sacrificed on Day 7. Kidneys were weighed.

Urine collection. The animals were placed in individual cages where urine was collected for 24 h on Day 0, Day 2, and Day 6. Urine volume, urinary Na⁺, K⁺, and creatinine were measured.

Endogenous creatinine clearance was calculated as follows:

\[ \text{CCr (ml/24 h)} = \frac{[\text{UCr (mg/ml)} \times \text{V (ml/24 h)}]}{\text{SCr (mg/ml)}} \]

24-hr urinary excretion of sodium (Na⁺) was calculated as follows:

\[ \text{UNaV (μEq/24 h)} = \text{UNa (μEq/ml)} \times \text{V (ml/24 h)} \]

24-hr urinary excretion of NAG and NGAL was similarly calculated.
The fractional excretion of Na\(^+\) (FE\(_{Na}\)), or percentage of the filtered sodium that is excreted into the final urine, is a measure of tubular Na\(^+\) reabsorptive function. It was computed as follows:
\[
FE_{Na} (%) = 100 \times \frac{U_{Na} (\mu\text{Eq/ml}) \times V (\text{ml/24 h})}{P_{Na} (\mu\text{Eq/ml}) \times C_{Cr} (\text{ml/24 h})}
\]

5 Treatment with anti-Adrenomedullin antibody improved several measures of kidney function on day 7 as compared to vehicle: serum creatinine 1.01 mg/dL (NT-M) vs 1.55 mg/dL (vehicle) (Fig. 11), BUN 32.08 mg/dL (NT-M) vs. 52.41 mg/dL (vehicle) (Fig. 12), endogenous creatinine clearance 934.43 mL/24 h (NT-M) vs. 613.34 mL/24 h (vehicle) (Fig. 13), fractional secretion of Na\(^+\) 0.98 % (NT-M) vs. 1.75 % (vehicle) (Fig. 14).

**Example 8**

In the mice CLP model described above, the effect of treatment with anti-adrenomedullin antibody NT-M on several parameters of kidney function was investigated.

NT-M caused a three- and two-fold higher diuresis and creatinine clearance, respectively, ultimately resulting in lower creatinine, urea, and NGAL blood concentrations at the end of the experiment (see Table 10). Moreover, keratinocyte-derived chemokine (KC) concentrations in the kidney were significantly lowered by treatment with NT-M (Fig. 15).

**Table 10:** Parameters of kidney function in the vehicle- (n=11) and NT-M-treated (n=9) animals. Blood concentrations were measured in samples taken at the end of the experiment. NGAL = neutrophil gelatinase-associated lipocalin. All data are median (quartiles).

The experiments were performed as follows:
Creatinine, urea, and neutrophil gelatinase-associated lipocalin (NGAL)

Blood NGAL concentrations were measured using a commercial ELISA (mouse NGAL, RUO 042, BioPorto Diagnostics A/S, Denmark, Gentofte). Urea and creatinine concentrations were measured with a capillary column (Optima-5MS, Macherey-Nagel, Düren, Germany) gas chromatography/mass spectrometry system (Agilent 5890/5970, Böblingen, Germany) using $^2$H$_3$-creatinine (CDN isotopes, Pointe-Claire, QU, Canada) and methyl-urea (FlukaChemikalien, Buchs, Switzerland) as internal standards. After deproteinization with acetonitrile, centrifugation and evaporation to dryness, the supernatant was reconstituted in formic acid, and extracted over a weak anion exchange column (WCX, Phenomenex, Aschaffenburg, Germany). Acetonitrile plus N,O-Bis(trimethylsilyl)trifluoroacetamide and N-(tert-butyldimethylsilyl)-N-methyltrifluoroacetamide allowed formation of the urea tert-butyldimethylsilyl- and the creatininetrimethylsilyl-derivatives, respectively. Ions m/z 231 and 245, and m/z 329 and 332 were monitored for urea and creatinine analytes and internal standards, respectively. From the urine output and the plasma and urine creatinine concentrations creatinine clearance was calculated using the standard formula.

Sample preparation

The kidney which was stored at -80°C was disrupted with a homogenizer in PBS and lysed with a 2-fold concentrated buffer for a whole cell lysate (100 mM Tris pH 7.6; 500 mM NaCl; 6 mM EDTA; 6 mM EGTA; 1 % Triton-X-100; 0,5 % NP 40; 10 % Glycerol; Protease-Inhibitors (β-Glycerocephosphate 2 mM; DTT 4 mM; Leupeptine 20 µM; Natriumorthovanadate 0,2 mM)) and subsequently centrifuged. The whole cell lysate was obtained out of the supernatant; the pellet consisting of cell remnants was discarded. The amount of protein was determined photometrically with a commercially available protein assay (Bio-Rad, Hercules, CA) and the specimens were adjusted in the way that the final protein concentration was 4 µg/µl. The samples for the Multiplex- and EMSA analysis were diluted 1:1 with EMSA buffer (10 mM Hepes; 50 mM KCl; 10 % Glycerol; 0,1 mM EDTA; 1 mM DTT), the samples for the immuno blots 1:1 with 2-fold Sample Buffer (2 % SDS; 125 mM Tris-HCL (pH 6,8 at 25°C); 10 % Glycerol; 50 mM DTT; 0,01 % Bromophenol blue).

Levels of keratinocyte-derived chemokine (KC) concentrations were determined using a mouse multiplex cytokine kit (Bio-Plex Pro Cytokine Assay, Bio-Rad, Hercules, CA), the
assay was performed by using the Bio-plex suspension array system with the manufacturer’s instructions (see also Wagner F, Wagner K, Weber S, Stahl B, Knöferl MW, Huber-Lang M, Seitz DH, Asfar P, Calzia E, Senftleben U, Gebhard F, Georgieff M, Rademacher P, Hysa V. Inflammatory effects of hypothermia and inhaled H2S during resuscitated, hyperdynamic murine septic shock. Shock 2011;35:396-402; and Wagner F, Scheuerle A, Weber S, Stahl B, McCook O, Knöferl MW, Huber-Lang M, Seitz DH, Thomas J, Asfar P, Szabó C, Möller P, Gebhard F, Georgieff M, Calzia E, Rademacher P, Wagner K. Cardiopulmonary, histologic, and inflammatory effects of intravenous Na2S after blunt chest trauma-induced lung contusion in mice. J Trauma 2011;71:1659-1667). In brief, the appropriate cytokine standards and samples were added to a filter plate. The samples were incubated with antibodies chemically attached to fluorescent-labeled micro beads. Thereafter, premixed detection antibodies were added to each well, and subsequently, streptavidin-phycoerythrin was added. Beads were then re-suspended, and the cytokines reaction mixture was quantified using the Bio-Plex Manager Software 4.1 using the standard curve produced from recombinant cytokine standards. Levels below the detection limit of the assays were set to zero for statistical purposes.

**Example 9**

In the mice CLP model described above, the effect of treatment with anti-adrenomedullin antibody NT-M on the liver was investigated.

NT-M caused a significant lowering of keratinocyte-derived chemokine (KC) concentrations in the liver (Fig. 16).

Measurement of keratinocyte-derived chemokine (KC) was done analogous to example 8 (kidney).

**Example 10**

In the mice CLP model described above, the effect of treatment with anti-adrenomedullin antibody NT-M on several cytokines and chemokines in the blood circulation (plasma) was investigated.

*Cytokine and chemokine concentrations*

In brief, the appropriate cytokine standards and samples were added to a filter plate. The samples were incubated with antibodies chemically attached to fluorescent-labeled microbeads. Thereafter, premixed detection antibodies were added to each well, and subsequently, streptavidin-phycoerythrin was added. Beads were then re-suspended, and the cytokines reaction mixture was quantified using the Bio-Plex protein array reader. Data were automatically processed and analyzed by Bio-Plex Manager Software 4.1 using the standard curve produced from recombinant cytokine standards. Levels below the detection limit of the assays were set to zero for statistical purposes.

In brief, the fluorescence-labeled microspheres ("beads") were added to a 96-well plate, followed by two washing steps, the addition of internal standards and the addition of plasma- and kidney homogenate samples. During the subsequent incubation the single cytokines bind to the antibodies attached to polystyrene-beads. After the addition of the cytokine-specific biotin-labeled antibodies, which are for the detection of the single cytokines, and an additional incubation time, subsequently phycoerythrin-labeled streptavidine was added. After an additional incubation time, beads were then resuspended, and the plates could be measured with a specific flow cytometer (Bio-Plex suspension array system, Bio-Rad, Hercules, CA). Data were automatically processed and analyzed by Bio-Plex Manager Software 4.1 using the standard curve produced from recombinant cytokine standards. For the plasma levels the concentration was provided in pg * mL⁻¹, the concentration of the kidney homogenates were converted to the appropriate protein concentration and provided in pg * mg⁻¹ protein.

NT-M caused a significant lowering of plasma concentrations of IL-6 (Fig. 17), IL-10 (Fig. 18), keratinocyte-derived chemokine (KC) (Fig. 19), monocyte chemoattractant protein-1 (MCP-1) (Fig. 20), TNF-alpha (Fig. 21).

**Example 11**

**Ischemia/Reperfusion-Induced Acute Kidney Injury**

Another non-septic acute kidney injury model has been established, where acute kidney injury is induced by ischemia/reperfusion (Nakamoto M, Shapiro JI, Shanley PF, Chan L, and Schrier RW. In vitro and in vivo protective effect of atriopeptin III on ischemic acute renal failure. J Clin Invest 80:698-705, 1987., Chintala MS, Bernardino V, and Chiu PJS. Cyclic GMP but not cyclic AMP prevents renal platelet accumulation following ischemia-reperfusion in anesthetized rats. J PharmacolExpTher 271:1203-1208, 1994). This model was used to assess whether treatment with anti-adrenomedullin antibody can improve kidney function.

The experiment was performed as follows:
Effect of a NT-M on Acute Kidney Injury Induced by Ischemia/Reperfusion in Rats

\(^a\) vehicle; injected intravenously (i.v.) 5 min before reperfusion on day 0, followed by injections on days 1 and 2.

\(^b\) NT-M at 4 mg/kg was injected intravenously (i.v.) 5 min before reperfusion on day 0, followed by 2 mg/kg i.v. each on days 1 and 2.

\(^c\) Urine collection on days -1, 0, 1 and 2, with blood chemistry and urine analysis on days 0, 1, 2 and 3, respectively. Plasma samples were collected in EDTA tubes (Days 0 (immediate before surgery), 1, 2: 100 μl, before vehicle or TA; Day 3:120 μl.

Clinical observations: daily before surgery, following surgery and throughout treatment.

Groups of 8 male Sprague-Dawley rats weighing 250 to 280 g were used. The animals were kept on a 12-hr light/dark cycle and receive a standard diet with distilled water ad libitum. The animals receive fluid supplements (0.9% NaCl and 5% dextrose/1:1, 10 ml/kg p.o.) 30 min prior to surgery (day 0). The rats were anaesthetized with pentobarbital (50 mg/kg, i.p.). The abdominal cavity was exposed via a midline incision, followed by intravenous administration of heparin (100 U/kg, i.v.) and both renal arteries were occluded for 45 min by using vascular clamps. Immediately after removal of the renal clips, the kidneys were observed for additional 1 min to ensure color change indicating blood reperfusion. The test compound (NT-M) and vehicle (phosphate buffered saline) were injected intravenously 5 min before reperfusion, followed by daily injection on days 1 and 2.

Urine collection. The 24-h urine collection on ice was initiated at 24h before ischemia/reperfusion on day -1 (-24h to 0h), and day 0 (0-24h), day 1 (24-48h) and day 2 (48-72h) after reperfusion,
Blood collection: 0.4 ml blood was collected through the tail vein into EDTA tubes at 0h (before I RI surgery), 24h (before vehicle or TA), 48h (before vehicle or TA) and 72h for determination of plasma creatinine/Na+/K+, and BUN; 2 ml blood was collected through venal cava terminally.

The animals were placed in individual cages where urine was collected for 24 h day -1 (-24h-0h), day 0 (0-24h), day 1 (24-48h) and day 2 (48-72h) after reperfusion on day 0. Urine volume, urinary Na+, K+, and creatinine were measured.

The creatinine clearance (CCr) was calculated as follows:

\[ \text{CCr (ml/24 h)} = \frac{\text{UCr (mg/ml)} \times \text{V (ml/24 h)}}{\text{PCr (mg/ml)}} \]

The 24-hr urinary excretion of sodium (Na+) was calculated as follows:

\[ \text{UNaV (\mu Eq/24 h)} = \frac{\text{UNa (\mu Eq/ml)} \times \text{V (ml/24 h)}}{\text{PNa (\mu Eq/ml) \times \text{CCr (ml/24 h)}}} \]

The fractional excretion of Na+ (FENa), or percentage of the filtered sodium that is excreted into the final urine, is a measure of tubular Na+ reabsorptive function. It was computed as follows:

\[ \text{FENa (%)} = 100 \times \frac{\text{UNa (\mu Eq/ml)} \times \text{V (ml/24 h)}}{\text{PNa (\mu Eq/ml) \times \text{CCr (ml/24 h)}}} \]

Treatment with anti-Adrenomedullin antibody improved several measures of kidney function:

Blood urea nitrogen (BUN) showed a strong increase in the vehicle group (0 h: 17.49 mg/dL, 24 h: 98.85 mg/dL, 48 h: 109.84 mg/dL, 72 h: 91.88 mg/dL), which was less pronounced with NT-M treatment (0 h: 16.33 mg/dL, 24 h: 84.2 mg/dL, 48 h: 82.61 mg/dL, 72 h: 64.54 mg/dL) (Fig. 22).

Serum creatinine developed similarly: Vehicle group (0 h: 0.61 mg/dL, 24 h: 3.3 mg/dL, 48 h: 3.16 mg/dL, 72 h: 2.31 mg/dL), NT-M group (0 h: 0.59 mg/dL, 24 h: 2.96 mg/dL, 48 h: 2.31 mg/dL, 72 h: 1.8 mg/dL) (Fig. 23).

The endogenous creatinine clearance dropped massively on day one and thereafter improved better in the NT-M group than in the vehicle group. Vehicle group: (0 h: 65.17 mL/h, 24 h: 3.5 mL/h, 48 h: 12.61 mL/h, 72 h: 20.88 mL/h), NT-M group: (0 h: 70.11 mL/h, 24 h: 5.84 mL/h, 48 h: 21.23 mL/h, 72 h: 26.61 mL/h) (Fig. 24).

Claims

1. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient for prevention or reduction of organ dysfunction or prevention of organ failure in said patient.

2. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to claim 1, wherein said anti-ADM antibody or said anti-adrenomedullin antibody fragment or said anti-ADM non-Ig scaffold is a non-neutralizing ADM antibody or a non-neutralizing adrenomedullin antibody fragment or a non-neutralizing ADM non-Ig scaffold.

3. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to claim 1 or 2, wherein said organ is kidney or liver.

4. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to claim 1 to 3, wherein said organ is heart.

5. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to any of the claims 1 to 4, wherein said antibody or fragment or scaffold binds to the N-terminal part (aa 1-21) of adrenomedullin.

6. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in
therapy of an acute disease or acute condition of a patient according to any of claims 1 to 5, wherein said antibody or antibody fragment or non-Ig scaffold is monospecific.

7. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding for use in therapy of an acute disease or acute condition of a patient according any of claims 1 to 6, wherein said antibody or fragment or scaffold exhibits a binding affinity to ADM of at least $10^{-7}$ M.

8. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding for use in therapy of an acute disease or acute condition of a patient according any of claims 1 to 7, wherein said antibody or fragment or scaffold is not ADM-binding-Protein-1 (complement factor H).

9. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to any of claims 1 to 8, wherein said antibody or fragment or scaffold recognizes and binds to the N-terminal end (aa1) of adrenomedullin.

10. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to any of claims 1 to 9, wherein said antibody or said fragment or scaffold is an ADM stabilizing antibody or fragment or scaffold that enhances the half life (t1/2 half retention time) of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least 50 %, more preferably >50 %, most preferably >100%.

11. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to any of claims 1 to 10, wherein said antibody or fragment or scaffold blocks the ADM bioactivity not more than 80 %, preferably not more than 50%.
12. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to any of claims 1 to 11, wherein said disease is selected from the group comprising sepsis, diabetes, cancer, heart failure, and shock.

13. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to any of claims 1 to 12, wherein said disease is not SIRS, sepsis, or septic shock.

14. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to any of claims 1 to 13, wherein said antibody or fragment is a human monoclonal antibody or fragment that binds to ADM or an antibody fragment thereof wherein the heavy chain comprises the sequences

SEQ ID NO: 1
GYTFSRYW

SEQ ID NO: 2
ILPGSGST

SEQ ID NO: 3
TEGYEYDGFDY

and wherein the light chain comprises the sequences

SEQ ID NO:4
QSIVYSNGNTY

SEQ ID NO: 5
RVS
SEQ ID NO: 6
FQGSHIPYT.

15. A human monospecific anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to claim 14, wherein said antibody or fragment comprises the sequences:

SEQ ID NO: 11 (AM-VH4-T26-E40-E55)
Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in therapy of an acute disease or acute condition of a patient according to any of claims 1 to 15, wherein said antibody or fragment or scaffold is a modulating antibody or fragment or scaffold that enhances the half life (t1/2 half retention time) of adrenomedullin in serum, blood, plasma at least 10 %, preferably at least 50 %, more preferably >50 %, most preferably >100% and that blocks the ADM bioactivity not more than 80 %, preferably not more than 50%.
17. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to
adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in
therapy of an acute disease or acute condition of a patient according to any of the claims
1 to 16 to be used in combination with vasopressors e.g. catecholamine and/or fluids
administered intravenously.

18. Anti-Adrenomedullin (ADM) antibody or an anti-ADM antibody fragment binding to
adrenomedullin or anti-ADM non-Ig scaffold binding to adrenomedullin for use in
therapy of an acute disease or acute condition of a patient according to any of the claims
1 to 16 or a combination according to claim 17 to be used in combination with ADM
binding protein and/or further active ingredients.

19. Pharmaceutical formulation comprising an anti-ADM antibody or anti-ADM antibody
fragment or anti-ADM non-Ig scaffold for use in a therapy of an acute disease or acute
condition of a patient according to any of claims 1 to 18.

20. Pharmaceutical formulation for use in therapy of an acute disease or acute condition of a
patient according to claim 19, wherein said pharmaceutical formulation is a solution,
preferably a ready-to-use solution.

21. Pharmaceutical formulation for use in therapy of an acute disease or acute condition of a
patient according to claim 20, wherein said pharmaceutical formulation is in a freeze-
dried state.

22. Pharmaceutical formulation according to any of claims 19 to 21, wherein said
pharmaceutical formulation is administered intra-muscular.

23. Pharmaceutical formulation according to any of claims 19 to 21, wherein said
pharmaceutical formulation is administered intra-vascular.

24. Pharmaceutical formulation according to claims 19 to 21, wherein said pharmaceutical
formulation is administered via infusion.
25. Pharmaceutical formulation according to claims 19 to 21, wherein said pharmaceutical formulation is to be administered systemically to a patient for prevention or reduction of organ dysfunction or organ failure in a patient having an acute disease or acute condition.

26. Pharmaceutical formulation according to claims 19 to 21, wherein said pharmaceutical formulation is to be administered systemically via infusion to a patient for prevention or reduction of organ dysfunction or organ failure in a patient having an acute disease or acute condition.

- scFv-fragment
- triabody
- tetrabody
- bivalent tandem scFv-fragment
- bivalent diabody
- bispecific tandem scFv2-fragment
- bispecific diabody
- bispecific knob into hole stabilized diabody
- bispecific single chain diabody
- bispecific disulfide bonds stabilized diabody
- bispecific tandem diabody

Fv and scFv-variants
Fig 1b:

**Heterologous fusions**

- Bivalent helix-stabilized scFv-dimer
- Four-helix-bundel stabilized scFv-tetramer
- Bispecific four-helix-bundel stabilized scFv-tetramer

**Bifunctional antibodies**

- scFv-streptavidin-fusion protein
- Fab-fusion proteins (e.g. to alkaline phosphatase)
- scFv-fusion proteins (e.g. to RNase, GFP, among others)
Fig. 1c:

- Single-chain-diabody-C\_H3-fusion protein
- single-chain-diabody-Fe-fusion protein
- scFv-Fc-fusion protein

Bivalent antibodies

- scFv-C\_L-fusion protein
- scFv-C\_H3-fusion protein
- Knob-into-hole-stabilized Fab-scFv-C\_H3-fusion protein

Bispecific antibodies

- Fab-scFv-fusion protein
- Fab-scFv-fusion protein
- (Fab-scFv)\_2-fusion protein
- scFv\_4-IgG-fusion protein
- IgG-scFv\_2-fusion protein

Fig. 3a:

Graph showing the relationship between % activation and hADM concentration.
Fig. 3 g:
Fig. 3 i:

Graph showing the relationship between CT-M concentration (µg/ml) and % inhibition. The graph depicts an increasing trend in % inhibition as the CT-M concentration increases from 0 to 100 µg/ml.

Graph showing the relationship between MR-M concentration (µg/ml) and % inhibition. The graph depicts an increasing trend in % inhibition as the MR-M concentration increases from 0 to 100 µg/ml, with a plateau at approximately 70% inhibition for concentrations above 10 µg/ml.

INTERNATIONAL SEARCH REPORT

A. CLASSIFICATION OF SUBJECT MATTER

INV. C07K16/26 A61K39/395 A61P31/00 A61P9/00 A61P13/12

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

C07K A61K A61P

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic database consulted during the international search (name of database and, where practicable, search terms used)

EPO-Internal, BIOSIS, EMBASE, WPI Data

C. DOCUMENTS CONSIDERED TO BE RELEVANT
