NITROXY SARTAN DERIVATIVES AS ANGIOTENSIN II RECEPTOR BLOCKERS FOR THE TREATMENT OF CARDIOVASCULAR AND INFLAMMATORY DISEASES

******

The present invention relates to Angiotensin II Receptor Blocker (ARB) nitroderivatives, pharmaceutical compositions containing them and their use for the treatment of cardiovascular, renal and chronic liver diseases, inflammatory processes and metabolic syndromes.

With the angiotensin II receptor blockers a class of compounds is intended, comprising as main components Losartan, EXP3174, Exp3179, Dup532, Candesartan, Tasosartan, Valsartan, Elisartan, Irbesartan and Olmesartan Olmesartan medoxomil.

ARBs are approved only for the treatment of hypertension, the antihypertensive activity is due mainly to selective blockade of AT1 receptors and the consequent reduced pressor effect of angiotensin II. Angiotensin II stimulates the synthesis and secretion of aldosterone and raises blood pressure via a potent direct vasoconstrictor effect.

Now, it has been reported that angiotensin II receptor blockers have side-effects such as for example hypotension, hyperkalaemia, myalgia, respiratory-tract disorders, renal disorders, back pain, gastrointestinal disturbances, fatigue, and neutropenia (Martindale, Thirty-third edition, p. 921).

Maria C. Breschi et al., in Journal of Medicinal Chemistry, 47 (23), 5597-5600, 2004, describes two NO-releasing Losartan of formulae 2a and 2b
and the results of an "exploratory" in vivo protocol evaluating the antihypertensive action of the compound of formula 2a in comparison with the "native" sartan and a ACE inhibitor (i.e. captopril). In this test all the compounds had shown practically equivalent effect on the reduction of the systolic blood pressure.

It was now object of the present invention to provide a new class of Angiotensin II Receptor Blocker nitroderivatives having an improved pharmacological activity an improved pharmacodinamic and pharmacokinetic profiles as compared to the compounds of the prior art. It has been so surprisingly found that angiotensin II receptor blocker nitroderivatives of the invention have a significantly improved overall profile as compared to native compounds both in term of wider pharmacological activity and enhanced tolerability.

In particular, it has been recognized that the angiotensin II receptor blocker nitroderivatives of the present invention exhibit a strong anti-inflammatory, antithrombotic and antiplatelet activity and can be furthermore employed for treating or preventing heart failure, myocardial infarction, ischemic stroke, atherosclerosis, ocular and pulmonary hypertension, hypertension, diabetic nephropathy, peripheral vascular diseases, left ventricular dysfunction and hypertrophy,
liver fibrosis, portal hypertension and metabolic syndromes.

Object of the present invention are, therefore, Angiotensin II Receptor Blocker nitroderivatives of general formula (I) and pharmaceutically acceptable salts or stereoisomers thereof:

The daily dose of active ingredient that should be administered can be a single dose or it can be an effective amount divided into several smaller doses that are to be
administered throughout the day. The dosage regimen and administration frequency for treating the mentioned diseases with the compound of the invention and/or with the pharmaceutical compositions of the present invention will be selected in accordance with a variety of factors, including for example age, body weight, sex and medical condition of the patient as well as severity of the disease, route of administration, pharmacological considerations and eventual concomitant therapy with other drugs.

The compounds of the invention may be administered orally, parenterally, rectally or topically, by inhalation or aerosol, in formulations eventually containing conventional non-toxic pharmaceutically acceptable carriers, adjuvants and vehicles as desired. Topical administration may also involve the use of transdermal administration such as transdermal patches or iontophoresis devices. The term “parenteral” as used herein, includes subcutaneous injections, intravenous, intramuscular, intrasternal injection or infusion techniques.

Injectable preparations, for example sterile injectable aqueous or oleaginous suspensions may be formulated according to known art using suitable dispersing or wetting agents and suspending agents. The sterile injectable preparation may also be a sterile injectable solution or suspension in a non-toxic parenterally acceptable diluent or solvent. Among the acceptable vehicles and solvents are water, Ringer’s solution and isotonic sodium chloride. In addition, sterile, fixed oils are conventionally employed as a solvent or suspending medium. For this purpose any bland fixed oil may be employed including synthetic mono or diglycerides, in addition fatty acids such as oleic acid find use in the preparation of injectables.
Suppositories for rectal administration of the drug can be prepared by mixing the active ingredient with a suitable non-irritating excipient, such as cocoa butter and polyethylene glycols.

Solid dosage forms for oral administration may include capsules, tablets, pills, powders, granules and gels. In such solid dosage forms, the active compound may be admixed with at least one inert diluent such as sucrose, lactose or starch. Such dosage forms may also comprise, as in normal practice, additional substances other than inert diluents, e.g. lubricating agents such as magnesium stearate. In the case of capsules, tablets and pills, the dosage forms may also comprise buffering agents. Tablets and pills can additionally be prepared with enteric coatings.

Liquid dosage forms for oral administration may include pharmaceutically acceptable emulsions, solutions, suspensions, syrups and elixirs containing inert diluents commonly used in the art, such as water. Such compositions may also comprise adjuvants, such as wetting agents, emulsifying and suspending agents, and sweetening, flavouring and the like.

Example 1
Synthesis of 4-((nitrooxy)butanoic acid pentafluorophenyl ester

To a mixture of pentafluorophenol (3.3 g, 17.96 mmol), 4-bromobutanoic acid (3.0 g, 17.96 mmol) and DMAP (0.440 g, 3.59 mmol) in CH₂Cl₂ (30 ml), cooled to 0°C, EDAC.HCl (5.2 g, 26.94 mmol) was added in portion. The mixture was then stirred at 0°C for 30 minutes. Then it was gradually warmed to room temperature and stirred for 8 hrs. Then the mixture was diluted with NaH₂PO₄ aqueous (5%, 50 ml) and acidified with HCl 1N to pH 3-4. The organic phase was separated and the aqueous phase was extracted with CH₂Cl₂ (2 x 50 ml). The organic phase was washed with brine, dried over Na₂SO₄ and evaporated to give an oil that was purified by flash chromatography (n-Hexane/EtOAc 98:2) to yield 4-bromobutanoic acid pentafluorophenyl ester (5.2 g, 86%) as a colorless oil.

A mixture of 4-bromobutanoic acid pentafluorophenyl ester (5.2 g, 15.61 mmol) and AgNO₃ (6.6 g, 39.03 mmol) in CH₃CN was heated at 60°C for 5 hrs under nitrogen, in the dark.
