Cross-Reference to Related Applications

This application claims priority from U.S. Provisional Application Serial Number 60/194,071, filed on March 31, 2000, our Docket Number ORT-1158 and U.S. Provisional Application Serial Number 60/____,____, filed on February 28, 2001, our Docket Number ORT-1366.

Field of the Invention

The invention relates to pharmaceutically-active fused heterobicyclic compounds and methods of using them to treat or prevent disorders and conditions, such as those mediated by the histamine H₃ receptor.

Background

The histamine H₃ receptor is located as a presynaptic autoreceptor in the central nervous system and as a presynaptic heteroreceptor on serotonergic, noradrenergic, dopaminergic, and cholinergic neurons. The histamine H₃ receptor is also located peripherally in tissues such as vascular smooth muscle cells.

inflammation such as migraine (McLeod et al., *Abstr. Society Neuroscience*, 1996, 22, 2010), asthma (Ichinose et al., *Eur. J. Pharmacol.*, 989, 174, 49), obesity, allergic rhinitis, substance abuse, bipolar disorders, manic disorders, and depression. Histamine H₃ antagonists alone or in combination with a histamine H₁ antagonist are believed to be useful in the treatment of upper airway allergic response or allergic rhinitis (US Patent Nos. 5217986, 5352707, and 5869479).

As noted, the prior art related to histamine H₃ ligands was comprehensively reviewed recently ("The Histamine H₃ Receptor-A Target for New Drugs", Leurs, R., and Timmerman, H., (Editors), Elsevier, 1998). Within this reference the medicinal chemistry of histamine H₃ agonists and antagonists was reviewed (see Krause et al. and Phillips et al., respectively). Thus the importance of an imidazole moiety containing only a single substitution in the 4 position was noted together with the deleterious effects of additional substitution on activity. Particularly methylation of the imidazole ring at any of the remaining unsubstituted positions was reported to strongly decrease activity.

**Summary of the Invention**

Using "alkyl" as an example, "alkyl" should be understood to include substituted alkyl having one or more substitutions, such as between 1 and 5, 1 and 3, or 2 and 4 substituents. The substituents may be the same (dihydroxy, dimethyl), similar (chlorofluoro), or different (chlorobenzyl- or aminomethyl-substituted). Examples of substituted alkyl include haloalkyl (such as fluoromethyl, chloromethyl, difluoromethyl, perchloromethyl, 2-bromoethyl, and 3-iodocyclopentyl), hydroxyalkyl, aminoalkyl, nitroalkyl, alkylalkyl, and so on.

\]

2-[4-[3-Piperidinopropoxy]phenyl]-1-(methylsulfonyl)-1H-indole

\[K_i = 7 \text{ nM}\]

10 Step A Preparation of 2-iodo-N-(methanesulfonyl)aniline

Methanesulfonyl chloride (4.4 mL, 57 mmol) was added to a 0°C dichloromethane (200 mL) solution containing 2-iodoaniline (5.0 g, 23 mmol) and triethylamine (9.6 mL, 69 mmol). The resulting mixture was stirred for 90 minutes, washed with HCl (0.5 M). The organics were separated then dried over sodium sulfate and concentrated in vacuo. The residue was then treated with potassium hydroxide (2.0 M in 1:1 methanol:water, 75 mL) for 30 min. This material was then diluted with dichloromethane and washed with HCl (1.0 N, 300 mL). The organics were separated then dried over sodium sulfate and concentrated to provide the title compound (5.15 g) as a tan solid.

Step B Preparation of 4-(methoxyethoxymethyl)benzaldehyde

Sodium hydride (2.4 g (60%), 60 mmol) was added to 4-hydroxybenzaldehyde (6.0 g, 50 mmol) in N, N-dimethylformamide (100 mL). The suspension was stirred for 1 hour and then treated with 2-methoxyethoxymethyl chloride (6.8 mL, 60 mmol), and allowed to stir an additional 16 hours. The reaction was then partitioned between water and ether:ethyl acetate (1:1). The organics were then washed with water (4x), dried (potassium carbonate), and concentrated. The crude materials were then purified by silica gel chromatography (hexanes:ethyl acetate) to afford the title compound (9.0 g)

Step C Preparation of 1-ethynyl-4-(methoxyethoxymethyl)benzene
Dimethyl[(2-diaz0-3-oxo)propyl] phosphonate was added in 4 portions to a suspension of potassium carbonate (4.96 g, 36 mmol), the product of Step B (3.78 g, 18 mmol), and methanol (50 mL). The reaction was stirred for 16 hours and concentrated in vacuo. The residue was taken up in ether, washed with water (3x), dried (potassium carbonate), and concentrated. The crude product was purified by silica gel chromatography (hexane:ethyl acetate) to provide the title compound (2.3 g).

Step D  Preparation of 2-(4-(methoxyethoxymethyl)phenyl)-1-(methanesulfonfyl)indole

The products of Step A (3.0 g, 10 mmol) and step C (2.2 g, 10 mmol) were combined in N, N-dimethylformamide (20 mL) and triethylamine (5 mL). The solution was then treated with dichlorobis(triphenylphosphine)palladium(II) (0.7 g, 1.0 mmol), copper(I)iodide (380 mg, 2.0 mmol), and stirred at 80 °C for 17 hours. The reaction was then diluted with ether:ethyl acetate (1:1, 200 mL), washed with water (5x), dried (potassium carbonate), and concentrated in vacuo. The crude material was then purified by silica gel chromatography (hexane:ethyl acetate) to afford the title compound (3.36 g).

A solution of the product of Step D (1.5 g, 4.0 mmol) in methanol (10 mL) was treated with HCl (10 mL, 4 N in dioxane). The reaction was allowed to stir for 2 hr, concentrated, and purified by silica gel chromatography (methanol:dichloromethane), to afford the title compound (0.93 g).

F. Biological Examples

**Biological Example 1**

1(A) Transfection of cells with human histamine receptor

A 10 cm tissue culture dish with a confluent monolayer of SK-N-MC cells was split two days prior to transfection. Using sterile technique the media was removed and the cells were detached from the dish by the addition of trypsin. One fifth of the cells were then placed onto a new 10 cm dish. Cells were grown in a 37°C incubator with 5% CO₂ in Minimal Essential Media Eagle with 10% Fetal Bovine Serum. After two days cells were approximately 80% confluent. These were removed from the dish with trypsin and pelleted in a clinical centrifuge. The pellet was then re-suspended in 400 μL complete media and transferred to an electroporation cuvette with a 0.4cm gap between the electrodes (Bio-Rad #165-2088). One μg supercoiled H₃ receptor cDNA was added to the cells and mixed. The voltage for the electroporation was set at 0.25 kV, the capacitance is set at 960 μF.

After electroporation the cells were diluted into 10 mL complete media and plated onto four 10cm dishes. Due to the variability in the efficiency of electroporation, four different concentrations of cells were plated. The ratios used were: 1:20, 1:10, and 1:5, with the remainder of the cells being added to the fourth dish. The cells were allowed to recover for 24 hours before adding the selection media (complete media with 600 μg/ml G418). After 10 days dishes were analyzed for surviving colonies of cells. Dishes with well-isolated colonies were used. Cells from individual colonies were isolated and tested.

SK-N-MC cells were used because they give efficient coupling for inhibition of adenylate cyclase. The clones that gave the most robust inhibition of adenylate cyclase in response to histamine were used for further study.

1(B) [3H]-N-methylhistamine binding

Cell pellets from histamine H₃ receptor-expressing SK-N-MC cells were homogenized in 20 mM TrisHCl/0.5mM EDTA. Supernatants from a 800 g spin were collected, reccentrifuged at 30,000 g for 30 minutes. Pellets were rehomogenized in 50 mM Tris/5mM EDTA (pH 7.4). Membranes were
incubated with 0.8 nM [³H]-N-methylhistamine plus/minus test compounds for 45 minutes at 25°C and harvested by rapid filtration over GF/C glass fiber filters (pretreated with 0.3% polyethyleneimine) followed by four washes with ice cold buffer. Filters were dried, added to 4 mL scintillation cocktail and then counted on a liquid scintillation counter. Non-specific binding was defined with 10 μM histamine. PKᵢ values were calculated based on a Kᵦ of 800 pM and a ligand concentration ([L]) of 800 pM according to the formula:

$$K_i = \frac{IC_{50}}{1 + ([L]/K_0)}$$
