UNITED STATES PATENT OFFICE.

ALFRED S. SEAMAN, OF FRACKVILLE, PENNSYLVANIA.

OIL-CLOTH KNIFE.

SPECIFICATION forming part of Letters Patent No. 322,755, dated July 21, 1885.

Application filed March 14, 1885. (Model.)

To all whom it may concern:

Be it known that I, ALFRED S. SEAMAN, a citizen of the United States, residing at Frackville, in the county of Schuylkill and State of Pennsylvania, have invented certain new and useful Improvements in Oil-Cloth Knives; and I do declare the following to be a full, clear, and exact description of the invention, such as will enable others skilled in the art to which it appertains to make and use the same, reference being had to the accompanying drawings, and to letters or figures of reference marked thereon, which form a part of this specification.

Figure 1 of the drawings is a representation of this invention, and is a perspective view. Fig. 2 is a section taken across the handle. Fig. 3 is a side view.

This invention has relation to knives for cutting oil-cloth; and it consists in the construction and novel arrangement of devices, all as hereinafter set forth, and pointed out in the appended claims.

The object of this invention is to provide a knife of special construction which is designed to be used in cutting forward or pushing the knife through the cloth, a mode of cutting which is often very desirable, especially in following an indicating-line with precision.

In the accompanying drawings, the letter A designates the handle of the knife, and B the blade. The latter is made with the tang portion C, which is preferably offset or without the line of prolongation of the upper edge, *d*, of the blade, being connected thereto by a neck portion, *e*. The lower edge, *f*, of the blade is beveled in front toward the lower guard-lug, *g*, of the cutting-edge. The cutting-edge *h* is at the front or point portion of the blade, being obliquely transverse with refer-

ence to the length of the blade, as shown. Above, or as a prolongation of the upper edge portion, *d*, of the blade at the upper end of the cutting-edge *h*, is formed the upper guard-lug, *k*, which serves to prevent the oil-cloth from slipping upward from the cutting-edge. The lower guard-lug, *g*, is at the lower end of the cutting-edge, and projects forward therefrom. It serves to guard the cutting-edge below, so that one sheet of oil-cloth can be cut while lying above another without danger of injury to the latter. The edges *d* and *f* are dull, and the lug *k* is set back somewhat with reference to the lug *g*.

The lugs *g* and *k*, and especially the latter, may be pointed for convenience in entering the knife through the oil-cloth at any particular place for action.

The handle A is usually made straight, and preferably consists of two lateral pieces, *z*, secured to the sides of a broad intermediate tang.

Having described this invention, what I claim, and desire to secure by Letters Patent, is—

1. A push-knife for cutting oil-cloth, having the transverse cutting-edge *h* at its point portion guarded above by a projecting lug, *k*, and guarded below by a projecting pointed lug, *g*, substantially as specified.

2. A knife for cutting oil cloth, having its point portion curved upwardly on its lower edge and provided with a cutting-edge having an upper and lower guard, substantially as specified.

In testimony whereof I affix my signature in presence of two witnesses.

ALFRED S. SEAMAN.
