(54) Title: FLUORINATED OLIGOMERS HAVING PENDANT FUNCTIONAL GROUPS

(57) Abstract: Described herein is an oligomer according to formula I: (I) wherein Y is an anionic group selected from the group consisting of: sulfates, carboxylates, phosphate, phosphonate, and sulfonate, wherein each X_i , X_2 , and X_3 are independently selected from F, CI, H, and CF₃; **R** is a linking group; each Z_i and Z_2 is independently selected from F and CF₃; **m** is at least 2; and **R**_i and **R**₂ are end groups, wherein the oligomer comprises substantially no pendant functional groups, except those selected from the group consisting of: sulfates, carboxylates, phosphate, phosphonate, and sulfonate.

FLUORINATED OLIGOMERS HAVING PENDANT FUNCTIONAL GROUPS

TECHNICAL FIELD

5

[0001] The present disclosure relates to fluorinated oligomers having pendant functional groups and methods of making and using the same. In one embodiment, the fluorinated oligomers of the present disclosure may be used as surfactants.

10

15

BACKGROUND

[0002] Anionic perfluorinated alkane compounds, such as perfluorooctanic acid and perfluroooctane sulfonic acid and their salts, have been found wide application in industry because of their good performance and unique properties (including inertness). However, the use of some of these anionic perfluorinated alkane compounds, especially those with eight carbons or longer, have been phased out due to environmental concerns.

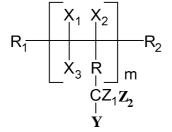

SUMMARY

20

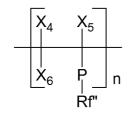

[0003] There is a desire to identify alternative fluorinated anionic compounds which have at least similar or better performance characteristics (e.g., surface tension) and properties and may be more environmentally acceptable. In one embodiment, the fluorinated anionic compounds may be used in harsh environments such as in strong acidic baths and under electrolysis conditions (e.g., chrome plating or

metal treatments).

[0004] In one aspect, an anionic oligomer is provided according to formula I:

- wherein Y is an anionic group selected from sulfates, carboxylates, phosphate, phosphonate, and sulfonate; each Xi, X₂, and X₃ are independently selected from F, CI, H, and CF₃; R is a linking group; each Zi and Z₂ is independently selected from F and CF₃; m is at least 2; Ri and R₂ are end groups.
 [0005] In one embodiment, the oligomer comprises substantially no pendant functional groups, except those selected from sulfates, carboxylates, phosphate, phosphonate, and sulfonate.
- 30 **[0006]** In another embodiment, the oligomer of Formula 1 further comprises at least one repeating unit of Formula II:

wherein each X_4 , X_5 , and X_6 are independently selected from F, CI, H, or CF₃; P is a covalent bond or an ether linkage; and Rf' is a perfluorinated alkyl group having 1 to 6 carbons that may comprise at least one catenary heteroatom; and n is at least 1.

- 5 [0007] In one embodiment, a method for making an anionic fluorinated oligomer is provided comprising i) the oligomerization of fluorinated olefinic monomer with a first functional group, wherein the first functional group can be converted into an anionic group; and ii) converting the first functional group into an anionic group, wherein the anionic group is selected from the group consisting of sulfonate, sulfate, carboxylate, phosphonate or phosphate.
- 10 [0008] The above summary is not intended to describe each embodiment. The details of one or more embodiments of the invention are also set forth in the description below. Other features, objects, and advantages will be apparent from the description and from the claims.

DETAILED DESCRIPTION

15 [0009] As used herein, the term

"a", "an", and "the" are used interchangeably and mean one or more;

"and/or" is used to indicate one or both stated cases may occur, for example A and/or B includes, (A and B) and (A or B); and

"linking group" refers to a divalent linking group. In one embodiment, the linking group includes at least 1 carbon atom (in some embodiments, at least 2, 4, 8, 10, or even 20 carbon atoms). The linking group can be a linear or branched, cyclic or acyclic structure, that may be saturated or unsaturated, substituted or unsubstituted, and optionally contains one or more heteroatoms selected from the group consisting of sulfur, oxygen, and nitrogen, and/or optionally contains one or more functional groups selected from the group consisting of ester, amide, sulfonamide, carbonyl, carbonate, urethane, urea, and carbamate. In another embodiment, the linking group does not comprise a carbon atom and is a catenary heteroatom such as oxygen, sulfur, or nitrogen.

[0010] Also, p as used herein, refers to a segment Q (e.g., a monomer) in a compound, such as in an oligomer. In this instance, "p" refers to the number of times segment Q is repeated in the compound

and may include either random or block oligomer configurations. For example, in $\begin{array}{c} \downarrow & \downarrow \\ p \end{array}$, where p is

3, the compound would include block co-oligomer and random co-oligomer configurations, for example, -QQQDDD- as well as -QDQDQD- or -DQQDQD-.

[0011] Also herein, recitation of ranges by endpoints includes all numbers subsumed within that range (e.g., 1 to 10 includes 1.4, 1.9, 2.33, 5.75, 9.98, etc.).

5 **[0012]** Also herein, recitation of "at least one" includes all numbers of one and greater (e.g., at least 2, at least 3, at least 4, at least 6, at least 8, at least 10, at least 25, at least 50, at least 100, etc.).

[0013] The present disclosure is directed to anionic oligomers having pendant functional groups selected from sulfates, sulfonates, carboxylates, phosphates, phosphonates, and combinations thereof.

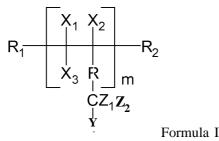

[0014] The oligomers of the present disclosure, comprising a repeating segment and two end groups, are shown in Formula I below:

15

20

25

wherein Y is selected from the group consisting of: sulfates, carboxylates, phosphate, phosphonate, and sulfonate; each X_1 , X_2 , and X_3 are independently selected from F, CI, H, and CF₃; R is a linking group, which may be saturated or unsaturated, substituted or unsubstituted, and optionally comprises at least one catenary heteroatom; each z_1 and Z_2 is independently selected from F and CF₃; m is at least 2; and Ri and R₂ are end groups.

[0015] In one embodiment R may be non-fluorinated, partially fluorinated, or perfluorinated. In some embodiments, the hydrogen atom in R may be replaced with a halogen other than fluorine, such as a chlorine. R may or may not comprise double bonds. Rmay be substituted or unsubstituted, linear or branched, cyclic or acyclic, and may optionally comprise a functional group (e.g., esters, ethers, ketones, amines, halides, etc.). In one embodiment, R is a catenary heteroatom such as oxygen, sulfur, or nitrogen. **[0016]** Ri and R_2 are end groups generated during oligomerization. Exemplary end groups may be independently selected from hydrogen, iodine, bromine, a linear or branched alkyl, and a linear or branched fluoroalkyl group, optionally containing at least one catenary heteroatom. In some embodiments, the alkyl or fluoroalkyl group has up to 20 carbon atoms. These end groups are typically generated from the initiator or chain transfer agent used to form the oligomer or during a chain transfer reaction. For example, when a nonfluorinated initiator is used, hydrogen atoms may be present as Ri and R_2 in Formula I. In one embodiment, Ri and R_2 are perfluorinated such as when perfluorinated initiator is used.

30 **[0017]** In one embodiment of the compound according to Formula I, Xi, X_2 , and X_3 are all F and R is a perfluorinated alkylene (in other words, a divalent perfluorinated carbon that may be linear or branched,

-3-

cyclic or acyclic, may comprise at least one catenary heteroatom, and may comprise 2, 3, 4, 6, 8, 10, 12, 18, or even 20 carbon atoms).

[0018] In one embodiment of the compound according to Formula I, R is selected from:

-(CH₂)_a⁻, -(CF₂)_a⁻, -0-(CF₂)_a⁻, -(CF₂)_a-0-(CF₂)_b⁻, -0(CF₂)_a-0-(CF₂)_b⁻, and -(CF₂)_a-[0-(CF₂)_b]_c⁻, -0(CF₂)_a-5
[0 -(CF₂)b]_c⁻, -[(CF₂)a-0]_b-[(CF₂)_c-0]_d⁻, -0[(CF₂)_a-0]_b-[(CF₂)_c-0]_d⁻, -0-[CF₂CF(CF₃)0]_a-(CF₂)_b-, and combinations thereof, wherein a, b, c, and d are independently at least 1, 2, 3, 4, 10, 20, etc.
[0019] In some embodiments, the oligomers of the present disclosure are highly fluorinated, meaning that 80%, 90%, 95%, or even 100% of the C-H bonds on the oligomer are replaced by C-F bonds, excluding the pendant anionic functional group (Y) such as the phosphate functional moiety (e.g., CH₂OP(0)(OM)₂) and the sulfate functional moiety (e.g., CH₂OS(0)₂OM).

[0020] An oligomer having C-F bonds and no C-H bonds, excluding the pendant pendant anionic functional group (Y). A perfluorinated oligomer of the present disclosure (i.e., Formula I) may comprise partially fluorinated or nonfluorinated end groups, depending on the reaction scheme used to generate the oligomer.

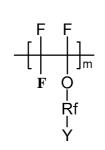

- 15 [0021] In other embodiments, the oligomers of the present disclosure (i.e., Formula I) are partially fluorinated, meaning that the oligomer (not including the end groups) contains at least one hydrogen atom connected to a carbon in the oligomer and also contains at least one fluorine atom connected to a carbon in the oligomer, excluding the pendant phosphate functional moiety and sulfate functional moiety.
 [0022] The oligomer of the present disclosure, comprises pendent functional groups selected from the
- 20 group consisting of: $-S0_{3}M$, $-C0_{2}M$, $-S0_{2}NR'CH_{2}C0_{2}M$, $-CH_{2}OP(0)(OM)_{2}$, $[-CH_{2}0]_{2}P(0)(OM)$, $-CH_{2}CH_{2}OP(0)(OM)_{2}$, $[-CH_{2}CH_{2}0]_{2}P(0)(OM)$, $-CH_{2}CH_{2}OS0_{3}M$, $-P(0)(OM)_{34}$ $S0_{3}NR'CH_{2}CH_{2}OP(0)(OM)_{34}$

 $[-S0_2NR'CH_2CH_20]_2P(0)(OM)_, -CH_2OS0_3M, and -S0_2NR'CH_2CH_2OS0_3M, and combinations thereof.$ As used throughout this disclosure M represents a cation.

[0023] Exemplary cations useful in the present disclosure include H⁺, NH₄⁺, PH₄⁺, H₃0⁺, Na⁺, Li⁺, Cs⁺, Ca⁺², K⁺, Mg⁺², Zn⁺², and Cu⁺², and/or an organic cation including, but not limited to N(CH₃)₄⁺, NH₂(CH₃)₂⁺, N(CH₂CH₃)₄⁺, NH(CH₂CH₃)₃⁺, NH(CH₃)₃⁺, ((CH₃CH₂CH₂CH₂)₄)P⁺, and combinations thereof.

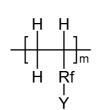

[0024] In one embodiment, the oligomer comprises a perfluorinated segment according to Formula la:

30

wherein Y is an anionic group, as previously described and m is at least 2. Rf is a perfluorinated divalent linking group which is perfluorinated and may be linear or branched, cyclic or acyclic structure, saturated or unsaturated, substituted or unsubstituted, and optionally contains one or more heteroatoms selected from the group consisting of sulfur, oxygen, and nitrogen.

5 **[0025]** In one embodiment, the oligomer comprises a partially fluorinated segment according to Formula lb:

10

wherein Y is an anionic group as previously described, m is at least 2, and Rf is a perfluorinated divalent linking group as defined in Formula la.

[0026]

[0027] Described below are representative oligomers with pendent functional groups and representative

15 processes for preparing them.

[0028] Polysulfate Oligomer:

[0029] In one embodiment, the anionic group Y in Formula I is a sulfate, for example,

-CH₂OS0 $_{3}$ M, -CH₂CH₂OS0 $_{3}$ M, and -S0 $_{2}$ NR'CH $_{2}$ CH₂OS0 $_{3}$ M, wherein R' is a H, or a CI to C4 alkyl group and M is a cation.

20 **[0030]** Exemplary segments comprising a pendent sulfate functional group include:

-[$CF_2CF(OCF_2CF_2CH_2OS0_3M)$]-, -[$CH_2CH((CF_2)_4CH_2OS0_3M)$]-,

 $-[CF_2CF(0(CF_2)_4CH_2OS0_3M)]-, -[CF_2CF(OCF_2CF(CF_3)CH_2OS0_3M)]-,$

 $-[CF_2CF(OCF_2CF(CF_3)OCF_2CF_2CH_2OS0_3M)]-, -[CH_2CH((CF_2)_4CH_2OS0_3M)]-,$

-[CF₂CF(OCF₂CF₂S0₂N(CH₃)CH₂CH₂OS0₃M)]-, -[CH₂CH(CF₂CF₂CH₂OS0₃M)]-,

25 -[CF₂CF(OCF₂CF₂CF₂CF₂SO₂N(CH₃)CH₂CH₂OSO₃M)]-, and

-[CH₂CH(CF₂CF₂CH₂OS0 ₃M)]-, wherein M is a cation.

[0031] Polysulfonate Oligomer

[0032] In one embodiment, the anionic group Y in Formula I is a sulfonate, for example, $-SO_3M$, wherein M is a cation.

30 **[0033]** Exemplary segments comprising a pendent sulfonate functional group include: $-[CF_2CF(OCF_2CF_2S0_3M)]-, -[CF_2CF(0(CF_2)_4S0_3M)]-, -[CF_2CF(OCF_2CF(CF_3)S0_3M)]-, -[CF_2CF(OCF_2CF(CF_3)OCF_2CF_2S0_3M)]-, -[CH_2CH(CF_2CF_2S0_3M)]-, -[CF_2CF(OCF_2CF(CF_3)OCF_2CF_2CF_2S0_3M)]-, -[CH_2CH((CF_2)_4S0_3M)]-, -[CH_2CH((CF_2)_4S0_3M)]-, and -[CH_2CH((CF_2)_4S0_3M)]-, wherein M is a cation.$

35 **[0034]** Polycarboxylate Oligomer

5

10

[0035] In one embodiment, the anionic group Y in Formula I comprises a carboxylate, for example - C0 ₂M or -S0 ₂NR'CH ₂C0 ₂M, wherein R' is H or a CI to C4 alkyl group and M is a cation.
[0036] Exemplary segments comprising a pendent carboxylate functional group include:
-[CF₂CF(OCF₂CF₂C0 ₂M)]-, -[CF₂CF(0(CF ₂)₅C0 ₂M)]-,
-[CF₂CF(OCF₂CF(CF₃) C0 ₂M)]-, -[CF₂CF(OCF₂CF(CF₃)0(CF ₂)_nC0 ₂M)]- where n is greater than 1, [CH₂CH(CF₂CF₂C0 ₂M)]-, -[CF₂CF(OCF₂CF(CCF₃)0(CF ₂)_nC0 ₂M)]-, where n is greater than 1, [CH₂CH((CF₂)₄C0 ₂M)]-, -[CF₂CF(OCF₂CF₂CO ₂M)]-, -[CH₂CH(CF₂CF₂C0 ₂M)]-, -[CF₂CF(OCF₂CF(CF₃)S0 ₂NR'CH ₂C0 ₂M)]-,
-[CF₂CF(0(CF ₂)₄S0 ₂NR'CH₂C0 ₂M)]-, -[CF₂CF(OCF₂CF(CF₃)S0 ₂NR'CH ₂C0 ₂M)]-,
-[CF₂CF(OCF₂CF(CF₃)OCF₂CF₂CF₂S0 ₂NR'CH ₂C0 ₂M)]-, -[CH₂CH(CF₂CF₂S0 ₂NR'CH ₂C0 ₂M)]-, [CF₂CF(OCF₂CF(CF₃)OCF₂CF₂CF₂CF₂S0 ₂NR'CH ₂C0 ₂M)]-, -[CH₂CH((CF₂)₄S0 ₂NR'CH ₂C0 ₂M)]-, -[CH₂CH(CF₂CF₂S0 ₂NR'CH ₂C0 ₂M)]-, [CH₂CH((CF₂)₄S0 ₂NR'CH ₂C0 ₂M)]-, -[CH₂CH(CF₂CF₂S0 ₂NR'CH ₂C0 ₂M)]-, and
-[CH₂CH((CF₂)₄S0 ₂NR'CH ₂C0 ₂M)]-, wherein R' is H or a CI to C4 alkyl group and M is a cation.
[0037] Polyphosphate Oligomer:
[0038] In one embodiment, the anionic group Y is a phosphate in Formula I, for example, -

15 $CH_2OP(0)(OM)_2$, [-CH₂0]₂P(0)(OM), -CH₂CH₂OP(0)(OM) ₂, [-CH₂CH₂0]₂P(0)(OM), [-S0 ₂NR'CH ₂CH₂0]₂P(0)(OM) and -S0 ₂NR'CH ₂CH₂OP(0)(OM) ₂ wherein R' is a CI to C4 alkyl group and M is a cation.

[0039] Exemplary segments comprising a pendent phosphate functional group include:

-[CF₂CF(OCF₂CF₂CH₂OP(0)(OM) ₂)]-,

20 $-[CF_2CF(0(CF_2)_4CH_2OP(0)(OM_2)], -[CF_2CF(OCF_2CF(CF_3)CH_2OP(0)(OM_2)],$

-[$CF_2CF(OCF_2CF(CF_3)OCF_2CF_2CH_2OP(0)(OM)_2)$]-,

-[CF₂CF(OCF₂CF₂S0 $_2$ N(CH $_3$)CH₂CH₂OP(0)(OM) $_2$)]-,

-[$CF_2CF(OCF_2CF_2CF_2CF_2S0_2N(CH_3)CH_2CH_2OP(0)(OM)_2)$]-,

-[CH₂CH(CF₂CF₂CH₂OP(0)(OM) ₂)]-, -[CH₂CH((CF₂)₄CH₂OP(0)(OM) ₂)]-,

25 -[CH₂CH(CF₂CF₂CH₂OP(0)(OM) ₂)]-, and -[CH₂CH((CF₂)₄CH₂OP(0)(OM) ₂)]-, where M is a cation. [0040] Polyphosphonate Oligomer:

[0041] In one embodiment, the anionic group Y in Formula I is a phosphonate, for example $-P(0)(OM)_2$, wherein M is a cation.

[0042] Exemplary segments comprising a pendent phosphonate functional group include:

30 -[CF₂CF(OCF₂CF₂P(0)(OM) $_2$)]-, -[CF₂CF(0(CF $_2$)₄P(0)(OM) $_2$)]-,

-[CF₂CF(OCF₂CF(CF₃)P(0)(OM) 2)]-, -[CF₂CF(OCF₂CF(CF₃)OCF₂CF₂P(0)(OM) 2)]-,

-[CH₂CH(CF₂CF₂P(0)(OM) 2)]-, -[CH₂CH((CF₂)₄P(0)(OM) 2)]-,

-[CH₂CH(CF₂CF₂P(0)(OM) $_2$)]-, and -[CH₂CH((CF₂)₄P(0)(OM) $_2$)]-, wherein M is a cation.

[0043] Method of Making

35 **[0044]** The pendent functional groups as described above can be formed using techniques known in the art. In one embodiment, the anionic fluorinated oligomer of the present disclosure is made by first

oligomerizing a fluorinated olefinic monomer (i.e., a monomer comprising a double bond) having a pendent first functional group and then converting the first functional group into an anionic group, wherein the anionic group is selected from the group consisting of a sulfonate, a sulfate, a carboxylate, a phosphonate, and a phosphate.

- 5 [0045] The first functional group (i.e., precursor functional group) is a group, which after undergoing a chemical reaction can be converted into a sulfonate, sulfate, carboxylate, phosphonate, or phosphate. In one embodiment, the precursor functional groups may be selected from the following: a hydroxyl group, a carboxylic acid ester group, a phosphate ester group, a sulfonyl fluoride or chloride, a sulfonate ester group, and a sulfinate group, although other techniques and methods as known in the art for obtaining the 10 oligomer of Formula I may be used.

[0046] First, fluorinated olefinic monomers comprising a first functional group are oligomerized using techniques known in the art. For example, the oligomerization of fluorinated olefinic monomers may be made as described in U.S. Prov. Appl. Nos. 61/424146 and 61/424153 both filed 17 December 2010, herein incorporated by reference in their entirety. Also see U.S. Pat. No. 6833418 (Tan et al.), 6203912

15 (Watakabe et al.) and 4982009 (Hung).

> [0047] In one embodiment, fluorinated olefinic monomers having the structure according to Formula III or IV may be oligomerized using techniques known in the art:

 $CF_2 = CF-0-R_f-Y'$ Formula III $CH_2 = CH - R_f - Y'$ Formula IV

20 In Formulas III and IV, R_f is linear or branched perfluorinated linking group, which may be saturated or unsaturated, substituted or unsubstituted and optionally comprises at least one catenary heteroatom; and Y' is a precursor (or first) functional group.

[0048] In another example, a fluorinated fluorosulfonyl vinyl ether monomer may be oligomerized using techniques known in the art.

25 [0049] In another example, a fluorinated carboxylate easier vinyl ether monomer may be oligomerized using techniques known in the art.

[0050] In yet another example, monomers comprising a phosphonate ester monomer may be oligomerized using techniques known in the art. For example, Scot Pedersen and et al. in J. Org. Chem., 61, 8024-803 1 (1996) reported the preparation of fluorinated vinyl ether monomer containing

30 phosphonate ester, $CF_2=CF-0-R_f-P(0)$ (OR")₂.

> [0051] In one embodiment, the monomers may be contacted with a conventional radical initiator in the oligomerization process. Such initiators include, for example, persulfates, peroxides (e.g., organic peroxides, such as diacyl peroxides, peroxyesters, dialkyl peroxides, hyrdoperoxides, etc.), photo irradiation, gamma irradiation, azo compounds, and the like. In some embodiments, more than one initiator may be used. In some embodiments, the initiator is selected from peroxidic compounds.

WO 2013/085864

5

10

15

PCT/US2012/067674

diacetyl peroxide), dipropionyl peroxide, dibutyryl peroxide, dibenzoyl peroxide, benzoyl acetyl peroxide, dilauroyl peroxide, disuccinic peroxide and diglutaric peroxide. In some embodiments, a preferred initiator is selected from perfluorinated peroxide compounds, such as CF₃C(0)-0-0-C(0)CF₃, and $CF_3O(CF_2)_2C(0)-0-O-C(0)CF_2CF_2OCF_3$, which can be made from the corresponding perfluorinated carboxylic acid or from the carboxylic acid halide. In addition, water-soluble peracids, such as peracetic acid, and their water-soluble salts (in particular the ammonium, sodium or potassium salts) or their esters, such as, for example, tert-butyl peroxyacetate and tert-butyl peroxypivalate, may be used. The watersoluble salts, in particular the ammonium, potassium and sodium salts of other peracids, such as peroxomono- and peroxodisulfates, perphosphates, perborates and percarbonates may also be employed. Perfluoroacyl peroxides or omega-hydroperfluoroacyl peroxides are furthermore suitable. Azo compounds useful in the present disclosure include azoisobutyronitrile and azo-2-cyanovaleric acid and the like. In some embodiments, certain water-soluble azo compounds are preferred. Conventional active redox systems that generate radicals to an adequate extent at temperatures between 10°C and 50°C can also be employed as initiators, above all in the low temperature range. An exemplary redox system includes the combination of water-soluble peroxidic compounds, preferably peroxodisulfates, with hydrogen sulfite or with disulfite or its addition products with formaldehyde, with thiosulfate and with diimine-liberating compounds, such as, for example, with hydrazine or azodicarboxamide may be used. The salts, preferably the alkali metal salts and, in particular, the ammonium salts, of the compounds mentioned are also present in the redox combinations.

20 [0052] In one embodiment, the entire amount of initiator can be added at the beginning of the oligomerization reaction. However, it may be expedient in relatively large batches to add initiator continuously during the course of the oligomerization. Equally, part of the amount of the initiator can alternatively be added at the beginning and the remainder in one or more batches can be added later. The addition of coactivators, i.e. for example, soluble salts of iron and of silver, may be advantageous, in particular when redox systems are used as initiators.

[0053] After oligomerization, the oligomers comprising the pendent first functional group may then undergo at least one chemical reaction to convert the first functional group into a second functional group, specifically an anionic functional group, more specifically a sulfonate, a sulfate, a carboxylate, a phosphonate, or a phosphate.

- [0054] In one embodiment, the oligomer comprises a first functional group of a hydroxyl (o-CH₂OH), which can be converted into sulfate and phosphate. At least two different reactions schemes are contemplated. In the first scheme, the oligomer is contacted with concentrated sulfuric acid or CISO ₃H, which converts the hydroxyl group into a sulfate group (e.g., -CH₂OSO ₃M) after neutralization. See for example, U.S., Pat. No. 2,559,751 (Lester et al.), which discloses the preparation of Rf-L-CH₂OSO ₃M
 from Rf-L-CH ₂OH. In the second scheme, the oligomer is contacted with P(0)Cl ₃ and limited water,
- which converts the hydroxyl group into a phosphate group (e.g., $-CH_2OP(=0)(OM)_2$ and/or [-

WO 2013/085864

PCT/US2012/067674

 $CH_{2}0$]₂P(=0)(OM)). See for example, U.S. Pat. Nos. 3,083,224 (Brace et al.), 3,094,547(Heine), and 4,064,067 (Lore); and JP Pat. No. 60064990 (Kawakami et al.). In the example with P(0)C1₃, P(0)(0H) ₂C 1 and P(0)(0H)C1 ₂ may be first formed during the initial reaction with limited water. P(0)(OH)Cl ₂ may react with the second hydroxyl group on the same oligomer or on a different oligomer

5 to generate, for example,

[-CH₂0]₂P(0)(OM), resulting in a cyclic or dimerized molecule

[0055] In one embodiment, a polyol oligomer may be obtained, such as by reduction of a polycarboxylate. In another embodiment, the polyol oligomer may be obtained by derivatization from a polysulfonyl fluoride or a polycarboxylate ester by reacting with for example, an omega-hydroxylamine.

10 [0056] In another embodiment, the oligomer comprises a first functional group of a carboxylic acid ester. In one reaction scheme the ester is saponified (i.e., hydrolyzed with a base) to the carboxylic acid salt group. Such saponification reactions are known in the art and include, for example, using an acid such as sulfuric acid or a base such as sodium hydroxide. In another reaction scheme, the ester group can be reduced to form a hydroxyl group (alcohol group), which may then be reacted using the reaction schemes

15 described previously.

30

[0057] In another embodiment, the oligomer comprises a first functional group of a phosphate ester. This phosphate ester group can be hydrolyzed to form the phosphoric acid salt group (e.g., $-P(=0)(OM)_2$). **[0058]** In yet another embodiment, the oligomer comprises a first functional group of a sulfonate ester (e.g., -SO ₃R). The oligomer can be hydrolyzed to form the sulfonate acid salt group (e.g., -SO ₃M).

- 20 **[0059]** In still another embodiment, the oligomer comprises a first functional group of a sulfonyl fluoride (e.g., -S0 ₂F) or chloride (e.g., -S0 ₂C1). In one reaction scheme, the oligomer is hydrolyzed to form the sulfonate acid salt group (e.g., -SO ₃M). A procedure for converting a sulfonyl fluoride to sulfonate can be found, for example, in J. Chem. Soc, 173 (1956) and 2640 (1957) by T. Gramstad and R.N. Haszeldine.
- 25 **[0060]** In another reaction scheme, the oligomer comprising a first functional group of a sulfonyl fluoride or chloride is reduced by using a reducing agent to form a sulfmate salt (e.g., -S0 ₂M), which can then be oxidized to form the sulfonate acid salt group.

[0061] Exemplary reducing agents useful include those known in the art, such as, for example, metal hydrides, such as $MeLH_4$, where Me is an alkaline metal and L is either an aluminum or a boron and MeH_v , where Me is either an alkaline metal or an alkaline earth metal, and x is 1 or 2.

- [0062] Exemplary oxidizing agents useful include those known in the art, such as, for example, oxygen, permanganate, chromate, perchlorate, and peroxides (e.g., R-O-O-R, wherein each R is independently selected from an alkyl group, an alkyl carbonyl group, H, an aryl group, or a substituted aryl group).
 [0063] In yet another reaction scheme, a precursor oligomer may be reacted with a compound
- 35 comprising an amine bearing a terminal first functional group or a second functional group. This reaction scheme enables the incorporation of amines into the oligomer.

-9-

[0064] In one embodiment, the oligomers of the present disclosure comprise a selection of segments comprising pendent sulfates, carboxylates, phosphate, phosphonate, and sulfonate groups. One skilled in the art can make oligomers comprising the selection of pendent functional groups using the processes described above. For example, an oligomer comprising two different first functional groups can be

5

10

15

prepared by co-oligomerization two functionalized monomers and then each of the first functional groups can be converted into the anionic functional group.

[0065] In one embodiment, the oligomer of the present disclosure may not comprise additional segments other than those comprising the pendent functional groups described above.

[0066] In one embodiment, the oligomers of the present disclosure do not comprise a substantial amount of pendent functional groups aside from sulfates, carboxylates, phosphate, phosphonate, and sulfonate. As used herein, a substantial amount means less than 10, 5, 3, 2, 1, 0.5, or even 0.1% by weight of the functional group versus then weight of the oligomer.

[0067] In another embodiment, additional monomers may be introduced into the oligomer to adjust the properties or to reduce the cost of the resulting oligomer. For example, additional monomers may be used to adjust the molecular weight or to change the hydrophobic/hydrophilic nature of the resulting product. In one embodiment, the additional monomers are introduced into the oligomer during oligomerization of the monomers.

[0068] In some embodiments, the oligomer of the present disclosure may further comprise a segment according to Formula V:

wherein Q is derived from a monomer and p is at least 1, 2, 3, 4, 5, 10, 20, etc. Generally, the amount of additional monomer is selected such that the ratio of the additional monomer to the pendent anionic segments described herein is no more than 50, 40, 30 or even 20 % mol versus the total.

[0069] The additional monomer may be selected from a non-fluorinated olefin, a partially fluorinated

25 olefin, and a perfluorinated olefin.

[0070] In one embodiment, the additional monomer is a compound selected from the following formula: $CX_7X_8=CX_9(R^1)$, wherein each of X_7, X_8, X_9 is independently selected from H or F; and R¹ is selected from I, Br, and R_f-U wherein U=I or Br, and R_f is a perfluorinated or partially perfluorinated alkylene group optionally containing O atoms.

30 **[0071]** In another embodiment, the additional monomer may be selected from non-fluorinated bromo- or iodo-olefins.

[0072] Exemplary additional monomers include, ethylene, tetrafluoroethylene, propylene, hexafluoropropylene, vinyl chloride, vinyl fluoride, vinyl iodide, allyl iodide, a fluoroalkyl substituted ethylene, vinylidene fluoride, fluorinated alkyl vinyl ethers, fluorinated alkoxy vinyl ethers,

35 bromotrifluoroethylene, chlorotrifluoroethylene, and combinations thereof.

-10-

- [0074] In one embodiment, the oligomer of the present disclosure may comprise even more additional (e.g., second, third, fourth, fifth, etc.) monomer segments selected from a non-fluorinated olefin, a partially fluorinated olefin, a perfluorinated olefin, and combinations thereof.
 [0075] The resulting oligomer of the present disclosure may be isolated and optionally purified by known methods. In one embodiment, the crude product is isolated from the aqueous reaction mixture by phase separation. In another embodiment, the crude solid is isolated by extracting with a solvent, such as halogenated solvent to remove insoluble inorganic impurity followed by the stripping out of solvent. Useful halogenated solvent are, such as, CH₂C I₂, CHC1₃, CCl₄, C1CH₂CH₂C1, C₄F₉OCH₃ and C₄F₉OCH₃.
- [0076] In some embodiments further purification of the crude product is sometimes not necessary. The
 elimination of the purification step may reduce processing time and cost. If desired, the reaction mixture or crude product may be purified, for example, by repeated water washing and phase separation.
 [0077] In one embodiment, resulting oligomers prepared according to the present disclosure may comprise a majority of segments corresponding to formula I, wherein a majority means at least 50, 60, 70 or even 80% by weight of the final product comprises segments corresponding to those in Formula I.
- [0078] In one embodiment, the resulting oligomers prepared according to the present disclosure have a number average molecular weight of no more than 20,000 grams/mole, 15,000 grams/mole, 10,000 grams/mole, 5,000 grams/mole, 2,000 grams/mole, 1000 grams/mol, or even 500 grams/mole.
 [0079] The oligomer of the present disclosure may be used to modify the surface energy of a solution. For example, it may be useful as a surfactant, an emulsifier, a leveling agent, or a wetting agent. In one embodiment, the fluorinated anionic compounds may be used for harsh environments such as acidic baths (e.g., chrome plating or metal treatments). The perfluorinated anionic compounds may be especially
 - useful in such environments.

30

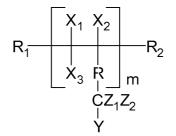

[0080] In one embodiment the oligomers of the present disclosure may be used as surfactants. In one embodiment, the oligomers of the present disclosure have a critical micelle concentration of no more than 25, or even 20 dyne/cm.

[0081] In one embodiment, the oligomers of the present disclosure have a surface tension of no more than 60, 50, 40, 30, 25, or even 20 dyne/cm at 1000 ppm.

[0082] A non-limiting list of exemplary embodiments and combinations of exemplary embodiments of the present disclosure are disclosed below.

35 [0083] Embodiment 1. A composition comprising an oligomer of Formula I:

-11-

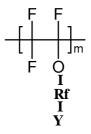

wherein Y is an anionic group selected from the group consisting of: sulfates, carboxylates, phosphate, phosphonate, and sulfonate, wherein each Xi, X_2 , and x_3 are independently selected from F, CI, H, and CF₃; R is a linking group; each Z_1 and Z_2 is independently selected from F and CF₃; m is at least 2; and Ri and R₂ are end groups, wherein the oligomer comprises substantially no pendant functional groups, except those selected from the group consisting of: sulfates, carboxylates, phosphate, phosphonate, and sulfonate.

[0084] Embodiment 2. The composition of embodiment 1, wherein the oligomer comprises a segment according to Formula la:

10

5

15

wherein Y is an anionic group selected from the group consisting of: sulfates, carboxylates, phosphate, phosphonate, and sulfonate; Rf is perfluorinated divalent linking group; and m is at least 2.

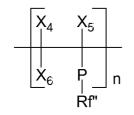

[0085] Embodiment 3. The compositon of any one of the previous embodiments, wherein the oligomer comprises a segment according to Formula lb:

20

wherein Y is an anionic group selected from the group consisting of: sulfates, carboxylates, phosphate, phosphonate, and sulfonate; Rf is perfluorinated divalent linking group; and m is at least 2.

[0086] Embodiment 4. The composition of any one of the previous embodiments, wherein the anionic group is selected from -SO₃M, -CO₂M -SO₂NR'CH₂CO₂M, -CH₂OP(0)(OM)₂, -CH₂CH₂OP(0)(OM)₂, -CH₂CH₂OP(0)(OM)₂, -CH₂CH₂OSO₃M, -P(0)(OM)₃₄ -SO₂NR'CH₂CH₂OP(0)(OM)₃₄
-CH₂OSO₃M, and -SO₂NR'CH₂CH₂OSO₃M, where M is a cation and R' is a H or a CI to C4 alkyl group.
[0087] Embodiment 5. The composition of any one of the previous embodiments, further comprises at least one repeating unit of Formula II:

wherein each X_4 , X_5 , and X_6 are independently selected from F, CI, H, or CF₃; P is a covalent bond or an ether linkage; and Rf' is a perfluorinated alkyl group having 1 to 6 carbons that may comprise a catenary heteroatom; and n is at least 1.

5 **[0088]** Embodiment 6. The composition of any one of the previous embodiments, wherein M is selected from the group consisting of K⁺, Na⁺, Li⁺, NH₄⁺, and combinations thereof.

[0089] Embodiment 7. The composition of any one of the previous embodiments, wherein the Ri and R_2 are perfluorinated.

[0090] Embodiment 8. The composition of any one of the previous embodiments, wherein R is $-(CH_2)_a$ -,

10 $-(CF_{2})_{a}$, $-0-(CF_{2})_{a}$, $-0(CF_{2})_{a}$, $-(CF_{2})_{a}$, $-0(CF_{2})_{b}$, $-0(CF_{2})_{b}$, $-(CF_{2}CF(CF_{3})0)_{a}$, $-0(CF_{2}CF(CF_{3})0)_{a}$, $-0(CF_{2}CF(CF_{3})0)_{a}$, $-0(CF_{2}CF(CF_{3})0)_{a}$, $-(CF_{2})_{b}$, $-(CF_{2})_{a}$, $-[(CF_{2})_{a}$, $-0(CF_{2})_{c}$, $-[(CF_{2})_{a}$, $-0]_{b}$, $-[(CF_{2})_{c}$, -0, $-[(CF_{2})_{c}$, $-0]_{c}$, -0, $-[(CF_{2})_{c}$, $-0]_{c}$, -0, -0, -1, -0, -1, -0, -1, -0, -1, -0, -1, -0, -1, -0, -1, -0, -1, -0, -1, -0, -1, -1, -0, -1, -1, -0, -1,

[0091] Embodiment 9. The composition according to any one of the previous embodiments, wherein the Xi, X_2 , and X_3 are all F, and -R-CZiZz-Y is -O-Rf^-Y wherein Rf³ is a perfluorinated alkylene.

[0092] Embodiment 10. The composition of any one of embodiments 1 or 2, wherein R is a catenary heteratom.

[0093] Embodiment 11. The composition according to any one of the previous embodiments, further comprising:

$$-\left[q \right]_{p}$$

15

20

wherein Q is derived from a monomer and p is at least 1.

[0094] Embodiment 12. The composition according to embodiment 11, wherein the monomer is selected from a non-fluorinated olefin, a partially fluorinated olefin, a perfluorinated olefin, and combinations thereof.

25 **[0095]** Embodiment 13. The composition according to any one of embodiments 11-12, wherein the monomer is selected from the following formula: $CX_7X_8=CX_9(R^1)$, wherein each of $X_{7,}X_{8,}X_9$ is independently selected from H or F; and R¹ is selected from I, Br, and R_f-U wherein U=I or Br, and R_f is a perfluorinated or partially fluorinated alkylene group optionally containing O atoms.

[0096] Embodiment 14. The composition according to any one of embodiments 11-12 wherein the

30 monomer is selected from: ethylene, tetrafluoroethylene, propylene, hexafluoropropylene, vinyl chloride, vinyl fluoride, a fluoroalkyl substituted ethylene, vinylidene fluoride, allyl iodide, fluorinated alkyl vinyl

-13-

ethers, fluorinated alkoxy vinyl ethers, bromotrifluoroethylene, chlorotrifluoroethylene, $CF_3CH=CH_2$, $C_4F_9CH=CH_2$, $CF_3OCF=CF_2$, $C_3F_7OCF=CF_2$, and $CF_2=CFOCF_2CF_2CF_2OCF_3$.

[0097] Embodiment 15. The composition according to any one of embodiments 1-2, 5-7, and 11-14, wherein the oligomer comprises $-[CF_2-CF(OC_4F_8S0_3M)]_m-[CF_2-CF(OC_3F_7)]_n-$, where M is a cation, m is at least 2 and n is at least 1.

[0098] Embodiment 16. A method of using the composition according to anyone of the previous embodiments as a surfactant, dispersant, leveling agent, emulsifier, or wetting agent.

[0099] Embodiment 17. A method for making an anionic fluorinated oligomer comprising i) the oligomerization of fluorinated olefinic monomer with a first functional group, wherein the first functional

10

5

group can be converted into an anionic group; and ii) converting the first functional group into an anionic group, wherein the anionic group is selected from the group consisting of: sulfonate, sulfate, carboxylate, phosphonate, and phosphate.

EXAMPLES

15 **[00100]** Advantages and embodiments of this disclosure are further illustrated by the following examples, but the particular materials and amounts thereof recited in these examples, as well as other conditions and details, should not be construed to unduly limit this invention. In these examples, all percentages, proportions and ratios are by weight unless otherwise indicated.

[00101] All materials are commercially available, for example from Sigma-Aldrich Chemical Company; Milwaukee, WI, or known to those skilled in the art unless otherwise stated or apparent.

[00102] These abbreviations are used in the following examples: bp = boiling point, g = gram; FTIR= Fourier Transform infrared spectroscopy; hr = hour; kPa = kilopascal; mol = mole; ml = milliliter, mm Hg = millimeters of mercury; meq = milliequivalent; N= normal; NMR= nuclear magnetic reasonance; MW = molecular weight; and ppm = parts per million.

Material/Nomenclature	Description and/or Source
MV4S	$CF_2=CF-O-C_4F_8-SO_2F$, made as described in the Example (section A to C) of U.S. Pat. No. 6,624,328 (Guerra)
o-MV4S	R-[CF ₂ CF(OC ₄ F ₈ SO ₂ F)]n-R where n=2-6 and R is H, C ₂ H ₅ , CF ₃ OCF ₂ CF ₂ , and/or C ₇ H ₁₅
LUPEROX TAEC	t-amyl peroxy 2-ethylhexyl carbonate commercially available from Arkema, Philadelphia, PA.
CTFE-Dimer	Tetrachlorohexafluorobutane, ClCFClCF ₂ CFClCF ₂ Cl, commercially available from Halocarbon Products Corp., River Edge, NJ
o-MV4SO3NH4	R-[CF ₂ CF(OC ₄ F ₈ SO ₃ NH ₄)]n-R where n=2-5 and R is H, C_2H_5 CF ₃ OCF ₂ CF ₂ , and/or C_7H_{15}
MV5CO2CH3	$CF_2=CF-O-C_5F_{10}-CO_2CH_3$, made as described in US 3,546,186 (Karcher et al.) starting with perfluoroadipoyl fluoride available from Exfluor Research Corp., Austin, TX and adding hexafluoropropylene oxide available from DuPont Company Wilington, DE
o-MV5CO2H	R-[CF ₂ CF(OC5F10CO ₂ H)]n-R where n=2-5 and R can be H, C_2H_5 and/or C_7H_{15}
o-MV5CO2NH4	R-[CF ₂ CF(OC5F10CO ₂ NH ₄)]n-R where n=2-5 and R can be H, C_2H_5 and/or C_7H_{15}
CF ₂ =CFO-C ₃ F ₇	Available from 3M Co., St. Paul, MN
BrCF ₂ CF ₂ CH=CH ₂	Available from SynQuest Lab, Alachua, FL
FC-72 FLUORINERT	A perfluorinated liquid, commercially available from 3M Company, St. Paul, MN under the trade designation "3M FLUORINERT ENGINEERED LIQUID FC-72"

10

[00104] Example 1: Preparation of a polysulfonate from hydrolysis of poly(sulfonyl fluoride): [00105] Preparation of 0-MV4S Oligomer: 220 g of MV4S monomer was oligomerized in a 500 mL flask with 20g "LUPEROX TAEC" peroxide at 110°C for 4 hrs under nitrogen. An additional 7.0 lg "LUPEROX TAEC" was added at 110°C and reacted for an additional 15 hrs. Distillation was carried out for 2 hrs at 110°C under full vacuum (< 0.5 kPa (4 mm Hg)) to remove unreacted MV4S monomer and low boiling point oligomers to yield 117.1g 0-MV4S oligomer (isolated yield 53%). From ¹⁹F NMR (fluorine- 19 nuclear magnetic resonance), no CF_2 =CF-0- was observed in the 0-MV4S oligomer as compared to that of the starting material MV4S. Liquid Chromatography-Mass Spectroscopy (LC-MS) analysis results are summarized in Table 1. Relative areas of the LC-MS indicated the general structure R^1 -(CF₂-CF(OCF₂CF₂CF₂CF₂S0₂F))_n-R² where n equals 2-6 and R¹ and R² were either H, C₂H₅ or C₇H₁₅. The average unit of oligomer had 3.2 units.

Table 1

5

10

* Below detection limit

[00106] Preparation of a polysulfonate from poly(sulfonyl fluoride): 7.5 g of 0-MV4S oligomer was dissolved in 5g $CH_3OCH_2CH_2OCH_3$, and 2g distilled water. The solution was treated with 4.5% KOH aqueous solution at room temperature with a magnetic stirring until the pH > 8. After reaction for 2 hours, the homogeneous solution showed no -CF2SO2F signal at +42 ppm from ¹⁹F NMR analysis, indicating complete hydrolysis. The solution then was acidified with 2N H_2SO_4 to a pH <2 and then extracted with t-butylmethyl ether (three times, using 50 mL each time). The combined extraction solutions were then stripped of solvent using rotary evaporation and 5.4 g of the desired product was obtained. The product was diluted with water to form a 10% solution. This solution was neutralized with IN NH₄OH (i.e., NH₃-H2O) and was further diluted with water to make a 5% aqueous solution for surface tension testing.

[00107] EXAMPLE 2: Preparation of a polysulfonate via polysulfinate:

[00108] 15 : A dispersion solution of 16.65 g NaBH₄ in 300g dried THF was made. 116 g 0-MV4S oligomer as described in the preparation of the 0-MV4S oligomer from Example 1 was dissolved in 106g dried THF and slowly added to the NaBH₄ dispersion solution at room temperature under nitrogen in 2 hours. After addition, the reaction temperature was increased to ~50°C, and reacted for an additional hour at this temperature. The reaction solution was analyzed by ¹⁹F NMR and all -SO2F signal had disappeared, and 20 the signal of -CF 2S0 2 was shifted from an original -111 ppm (-CF 2S0 2F) to -117 ppm and desired -128 ppm (-CF2SO2M) at the ratio of 1 to 1. Upon subsequent hydrolysis of the solution with $H_{2}SO_{A-H2O}$ (2N), the signal at -117 ppm disappeared and the signal at -128 ppm increased, indicating the signal at -117 ppm was -CF2SO2 -B, which converted into -CF2SO2 -H during the acidification. The acidified solution was extraction with t-butylmethylether (3x200mL each time). The combined extraction were 25 washed with water (50mL), rotary evaporated to remove solvent yielding 181.5 g of isolated wet polysulfinate product (theoretically 111.3 g product) with a purity of 61%.

[00109] Oxidation of -[CF $_2$ -CF(OCF2CF2CF2CF $_2$ SO $_2$ H)]n- to -[CF $_2$ -CF(OCF $_2$ CF2CF2CF $_2$ SO $_3$ NH $_4$)]n-: 8.2 g of wet polysulfinate product from above, -[CF $_2$ -

-16-

 $CF(OCF_2CF_2CF_2CF_2SO_2H)]_n$, was directly treated with excess H_2O_2 aqueous solution (30% wt) at room temperature. The reaction was exothermic and the solution temperature increased to about 60°C. The mixture was allowed to cool to room temperature and then continually stirred at room temperature for one hour. ¹⁹F NMR analysis showed that all of the **-CF**₂SO₂H (-130.4 ppm) was converted to **-CF**₂SO₃H (-

5

112.5 ppm). This sample was diluted with water to form a 10% solution. This solution was neutralized with $IN NH_4OH$ to a pH of -7.5 and was further diluted with water to make a 5% aqueous solution for surface tension testing.

[00110] EXAMPLE 3: Preparation of polysulfonate co-oligomer from MV4S and CF_2 =CFO-C $_3F_7$ (77 to 23 by mole ratio):

- 10 **[00111]** In a sealed 500 mL Parr pressure reactor, 105 g MV4S and 26 g $C_3F_7OCF=CF_2$ were cooligomerized in the presence of IOg LUPEROX TAEC at 110°C for 5 hours. 135 g of solution was isolated from the reactor. The solution was then distilled at 110°C, then at full vacuum pressure (<4 mmHg) for 1 hours. 46.2 g of oligomer was obtained. From ¹⁹F NMR analysis, no $CF_2=CF-0$ - signal was observed and the mole ratio of $-OC_4F_8SO_2F$ and $-OC_3F_7$ was 77 to 23. The co-oligomer of MV4S and
- 15 $C_{3}F_{7}OCF=CF_{2}$ was hydrolyzed with KOH as described in Example 1. The sample was diluted with water to form a 10% solution (5g of oligomer and 45 g of distilled water). This solution was neutralized with IN NH₄OH to a pH of ~7.5 and was further diluted with water (about 100 g) to make a 5% aqueous solution for surface tension testing.

[00112] EXAMPLE 4: Preparation of polysulfonate co-oligomer from MV4S and CF_2 =CFO-C $_3F_7$ 20 (87 to 13 by mole ratio):

[00113] Following the same procedure as described in Example 3, 95 g MV4S and 13 g $C_3F_7OCF=CF_2$ were co-oligomerized in the presence of IOg LUPEROX TAEC at 110°C for 5 hours. 42g of oligomer was isolated with the mole ratio of -OC $_4F_8SO_2F$ and -OC $_3F_7$ of 87 to 13. Similary, the oligomer of MV4S and $C_3F_7OCF=CF_2$ was hydrolyzed with KOH and 100g of 5% aqueous solution was prepared for surface tension testing.

[00114] EXAMPLE 5 Preparation of polysulfonate co-oligomer from debromo-sulfmation oligomerization of BrCF₂CF₂CH=CH₂ and C₄F₉CH=CH₂ with Na₂S₂O₄:

[00115] Preparation of polysulfinate co-oligomer from debromo-sulfmation oligomerization of BrCF₂CF₂CH=CH₂ and C₄F₉CH=CH₂ with Na₂S₂O₄: 138 g deionized water, 100 g CH₃CN and ₂5g NaHCO ₃ were charged into a 600 mL PARR pressure reactor. The solution was bubbled with nitrogen gas for 2 minutes to remove oxygen. 50g BrCF₂CF₂CH=CH₂ and IOg C₄F₉CH=CH₂ (available from Aldrich) were then added under a nitrogen atmosphere, followed by 58g Na₂S204. The reactor was sealed and reacted at 60°C (internal temperature) with stirring for 24 hours. After cooling to 20°C, the remaining pressure was released, and 353g liquid (2 phases) with some solids was obtained. ¹⁹F NMR analysis indicated fluorinated products in the upper phase, but not the lower phase. The solution was filtered to remove solids and 115g of the top clear solution was isolated. Rotary evaporation of the top phase to

25

35

polydispersity of 1.2.

5

20

remove solvent yielded 33g of a semisolid. The semisolid was acidified with 2N H₂SO₄ to a pH of about 1, and then extracted twice with 200mL t-butylmethyl ether. The solvent from the combined extracts was removed by rotary evaporation and the remaining liquid was dried under full vacuum overnight to yield 31.26g of a clear liquid. ¹⁹F NMR analysis indicated a signal corresponding to $CF_3CF_2CF_2CF_2$, a small amount of BrCF₂- and complicated multiple signals between -113 and -134 ppm (chemical shift) indicating the presence of sulfinate group (-CF ₂SO ₂Na). No CH₂=CH- signal was observed from the isolated product by FT-IR and ^-NMR analyses. GPC (gas phase chromatography) analysis showed a number average molecular weight of 810 g/mol, a weight average molecular weight of 990 g/mol and a

- 10 **[00116]** Oxidation of polysulfinate co-oligomer: 5 g sulfinate oligomer (made from above debromo-sulfionation oligomerization of $BrCF_2CF_2CH=CH_2$ and $C_4F_9CH=CH_2$ with $Na_2S_20_4$) was oxidized with excess 30% H_2O_2 to make the sulfonated oligomer. The reaction was monitored by ¹⁹F-NMR which showed a decreased signal at around -128 to -134 ppm, and increased signal around -110 to -120 ppm. A 100g of 5% solution was made for surface tension testing.
- 15 [00117] EXAMPLE 6: Preparation of polysulfonate oligomer by oligomerization of MV4S with $(CF_3OC_2F_4CO_2)_2$:

[00118] Preparation of $(CF_3OC_2F_4CO_2)_2$: 280 g (1.2mol) $CF_3OC_2F_4COF$ (made by electrochemical fluorination as described in example 2 of U.S. Pat. No. 2,7 13,593 to Brice et al) was added to excess methanol cooled to -20°C in a 1 L 3-neck round bottom flask. This solution was then water washed to isolate 295 g (1.2mol) $CF_3OC_2F_4CO_2CH_3$ as the fluorochemical lower phase. A charge of 89 g (1.35mol) KOH in 150 g water was then added to the isolated lower phase to form the $CF_3OC_2F_4CO_2K$ salt. The salt was dried, then acidified with 150 g of concentrated H_2SO_4 in 150 g water, and then vacuumed distilled to isolate 314 g (1.3mol) of $CF_3OC_2F_4CO_2H$.

[00119] 50 g (0.22mol) CF₃OC₂F₄CO₂H, 4 g dimethylformamide, and 30 g (0.2.5mol) thionyl chloride
 were reacted in a 500 mL 3-neck round bottom flask at 72°C for one hour followed by distillation to give 46 g (0.19mol) CF₃OC₂F₄COCl. To a 250ml 3-neck round bottom flask was added 4.7 g (0.05mol) 35% HOOH which was then cooled to 0°C with stirring, followed by the addition of 4 g (0.1mol) of NaOH in 90 g water. The reaction was kept at 10°C and held for 30 min followed by addition at 10°C of 20 g (0.08mol) CF₃OC₂F₄COCI in 180 g of "FC-72 FLUORTNERT". The solution was stirred at 10°C for 30 min and the lower phase was removed containing 10 weight % CF₃0 C₂F₄C(0)OOC(0)C ₂F₄OCF₃ in FC-72 FLUORTNERT confirmed by ¹⁹F-NMR and FTIR.

[00120] Oligomerization of MV-4S with $CF_3OC_2F_4C(0)0$ -OC(0)C $_2F_4OCF_3$: 120 g (0.32mol) MV4S was added to a 500ml 3-neck round bottom flask with a stir bar and cooled to 0°C. This was followed by addition of 100 g of 10 weight percent (0.02mol) $CF_3OC_2F_4C(0)OOC(0)C$ $_2F_4OCF_3$ in FC-72

35 FLUORTNERT with stirring at 10°C for 2 hrs. The solution was further reacted for 20 hrs at 25°C. The product mixture was fractionated to give 11 g of 0-MV4S having a boiling point greater that 150°C at 8

-18-

WO 2013/085864

PCT/US2012/067674

mm vacuum. $F^{19}NMR$ confirmed the desired perfluorinated 0-MV4S having $CF_3OCF_2CF_2$ - end groups and the general structure $CF_3OCF_2CF_2$ -[$CF_2CF(OC_4F_8SO_2F)$]n- $CF_2CF_2OCF_3$ where n was an average of 15. The oligomer had an average molecular weight of 6050 g per mole under this reaction condition and work up.

5 **[00121]** The high MW (molecular weight) oligomer with $CF_3OCF_2CF_2$ - end group from above was hydrolyzed to make the corresponding $CF_3OCF_2CF_2$ -[$CF_2CF(OC_4F_8SO_3NH_4)$]_n- $CF_2CF_2OCF_3$ oligomer, which showed low solubility in water.

[00122] Example 7: Preparation of polysulfonate oligomer by oligomerization of MV4S in CTFE-dimer solvent:

- 10 [00123] Oligomeric fluoromultisulfinic acid ammonium salt was made by first oligomerization of MV4S fluoromonomer to 0-MV4S. 430g (1.13mol) MV4S, 100g CTFE-Dimer and 58g (0.25mol) LUPEROX 575 were charged to an evacuated 600ml SERIES 4520 PARR reactor, commercially available from Parr Instruments, Moline, IL. The mixture was stirred and heated to 65°C for 20 hours. A slight pressure rise was measured and vented after the reaction reached 20 °C. A product mixture was
- 15 drained and fractionated to give 134g of 0-MV4S boiling greater than 220°C and 50 mm that remained in the pot. The higher boiling material was subjected to LCMS and relative areas indicated the general structure R-[CF₂CF(OC₄F₈S0₂F)]_n-R where n=2-5 and R was H, C₂H₅ and/or C₇Hi₅. The average oligomer was 2.9 units for an average molecular weight of 1200 g/mol. The oligomer was hydrolyzed with caustic, acidified, and treated with ammonium hydroxide and vacuum dried to make 0-20 MV4S03NH4.

[00124] Example 8A and 8B: Preparation of polycarboxylate oligomers:

[00125] Oligomeric fluoromulticarboxylic acid ammonium salt was made by oligomerization of MV5C02CH3 fluoromonomer to 0-MV5C02CH3. 200g (0.49mol) MV5C02CH3 and 20 g (0.09mol) LUPEROX 575 were charged to an evacuated 600ml SERIES 4520 PARR reactor, commercially 25 available from Parr Instruments, Moline, IL. The mixture was stirred and heated to 65°C for 20 hours. A slight pressure rise was measured and vented after the reaction reached 20oC. A product mixture was drained and fractionated to give 89g of 0-MV5C02CH3 after removing the starting material. Two cuts were obtained by vacuum fractionation of cut 1 from 62-200°C/l mm vacuum of 54g and the greater than 200°C/lmm of 35g cut 2 in the pot. The materials were subjected to LCMS and relative areas indicated 30 the general structure R-[CF₂CF(OC₅F₁₀CO₂CH₃)]_n-R where n=2-5 and R was H, C₂H₅ and/or C₇H₁₅. The average oligomer was 2.09 units for an average molecular weight of 950 g/mol for cut 1 (Example 8A), and 2.93 units for an average molecular weight of 1290 g/mol for cut 2 (Example 8A). The oligomer was reacted with sodium hydroxide, vacuum stripped to remove methanol, acidified with concentrated sulfuric acid and made into the ammonium salt by titration with ammonium hydroxide and vacuum dried to make 35 0-MV5C02NH4.

Table 1

[00126] Surface Tension Measurement

[00127] The surface tension was tested as follows: various dilutions of each of the above Examples and Comparative Examples were prepared. A Kruss Tensiometer (model K 12, from Kruss USA, Matthews,

NC) was used to take at least five measurements of each dilution. The measurements were continued until

5

the standard deviation of the last five measurements was 0.07 dyne/cm or less. The average of the last five measurements was reported for each concentration point.

[00128] Examples 1-5, 7, 8A and 8B from above where diluted in water. The results of the Surface Tension Measurement from Examples 1-5, 7, 8A and 8B are shown in Table 1 below. The concentration used for each sample was within 1ppm of the value listed in Table 1.

1	\mathbf{n}
1	.,

l abl	le I							
Conc.	Surface Tension (dyne/cm) for the Examples							
(ppm)	1	2	3	4	5	7	8A	8B
0	74.00	74.22	74.24	73.08	73.15	73.48	72.50	72.64
124	49.78	56.95	72.11	39.73	45.49	73.18	38.42	51.03
307	34.19	45.59	49.12	25.28	32.98	44.52	32.76	42.45
572	30.93	36.57	37.46	21.94	29.73	33.38	29.56	37.93
935	29.05	29.38	31.87	20.57	26.75	27.65	28.22	36.98
1403	27.97	27.43	33.59	19.99	25.62	26.65	26.65	36.08

651	52.22

15

[00130] Comparative Example 1 (CE1) was $CF_3OCF_2CF_2CF_2OCFHCF_2C0_2NH_4$ prepared as described in U.S. Pat. No 7,671,1 12 (Hintzer et al.).

[00131] Comparative Example 2 (CE2) is $C_7Fi_7C0_2NH_4$, also known as ammonium perfluorooctanoic acid.

20 **[00132]** Comparative Example 3 (CE3) is $C_8F_{17}SO_3K$, also known as perfluorooctane sulfonate potassium salt.

[00133] Each comparative example was diluted in water to a given concentration and the surface tension measured. The results of the Surface Tension Measurement are shown in Table 3 below.

1000	NT	NT	33	
1210	NT	52.28	NT	

NT= not tested

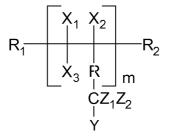

[00134] As shown in the above Tables, the oligomers of the present disclosure, have surface tension values similar to or lower than the comparative examples.

[00135] Foreseeable modifications and alterations of this invention will be apparent to those skilled in the art without departing from the scope and spirit of this invention. This invention should not be restricted to the embodiments that are set forth in this application for illustrative purposes. To the extent that there is a conflict or discrepancy between this specification and the disclosure in any document

10 incorporated by reference herein, this specification will control.

What is claimed is:

1. A composition comprising an oligomer of Formula I:

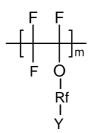

5

10

wherein Y is an anionic group selected from the group consisting of: sulfates, carboxylates, phosphate, phosphonate, and sulfonate, wherein each X_1 , X_2 , and X_3 are independently selected from F, CI, H, and CF₃; R is a linking group; each Zi and Z₂ is independently selected from F and CF₃; m is at least 2; and Ri and R₂ are end groups, wherein the oligomer comprises substantially no pendant functional groups, except those selected from the group consisting of: sulfates, carboxylates, phosphate, phosphonate, and sulfonate.

2. The composition of claim 1, wherein the oligomer comprises a segment according to Formula la:

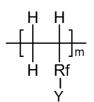

15

20 wherein Y is an anionic group selected from the group consisting of: sulfates, carboxylates, phosphate, phosphonate, and sulfonate; Rf is perfluorinated divalent linking group; and m is at least 2.

3. The compositon of any one of the previous claims, wherein the oligomer comprises a segment according to Formula lb:

25

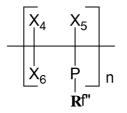

wherein Y is an anionic group selected from the group consisting of: sulfates, carboxylates, phosphate,
 phosphonate, and sulfonate; Rf is perfluorinated divalent linking group; and m is at least 2.

4. The composition of any one of the previous claims, wherein the anionic group is selected from -SO $_3M$,

-S0₂NR'CH ₂C0₂M, -CO₂M -CH₂OP(0)(OM) ₂, $-CH_{2}CH_{2}OP(0)(OM)_{2}, -CH_{2}CH_{2}OS0_{3}M, -P(0)(OM)_{2}, -S0_{2}NR'CH_{2}CH_{2}OP(0)(OM)_{34}$ -CH₂OSO₃M, and -SO₂NR'CH ₂CH₂OSO₃M, where M is a cation and R' is a H or a CI to C4 alkyl group.

5

5. The composition of any one of the previous claims, further comprises at least one repeating unit of Formula II:

10

wherein each X4, X5, and X6 are independently selected from F, CI, H, or CF3; P is a covalent bond or an ether linkage; and Rf' is a perfluorinated alkyl group having 1 to 6 carbons that may comprise a catenary heteroatom; and n is at least 1.

6. The composition of any one of the previous claims, wherein R is $-(CH_2)_{a^-}$, $-(CF_2)_{a^-}$, $-0-(CF_{2})_{a}^{-}, -0(CF_{2})_{a}^{-}, -(CF_{2})_{a}^{-}, -0(CF_{2})_{b}^{-}, -0(CF_{2})_{a}^{-}, -0(CF_{2})_{b}^{-}, -(CF_{2}CF(CF_{3})0)_{a}^{-}, -0(CF_{2}CF(CF_{3})0)_{a}^{-}, -0(CF_{2}CF(CF_{3})0)_{a}^{-}, -(CF_{2})_{b}^{-}, -(CF_{2})_{a}^{-}, -(CF_{2})_{a}^{-}, -(CF_{2})_{a}^{-}, -(CF_{2})_{a}^{-}, -(CF_{2})_{b}^{-}, -(CF_{2}$ 15 $-[(CF_{2})_{a}-0]b-[(CF_{2})_{c}-0]_{d}^{-}, -[(CF_{2})_{a}-0-]b-[(CF_{2}CF(CF_{3})0)_{c}-]_{d}^{-}, -0-[CF_{2}CF(CF_{3})0]_{a}-(CF_{2})_{b}^{-},$ and combinations thereof, wherein a, b, c, and d are independently at least 1.

20 7. The composition according to any one of the previous claims, wherein the Xi, X2, and X3 are all F, and -R-CZiZz-Y is -0-Rf³-Y wherein Rf³ is a perfluorinated alkylene.

8. The composition according to any one of claims 1-2, and 5, wherein the oligomer comprises $-[CF_2 CF(OC_4F_8SO_3M)]_m$ - $[CF_2-CF(OC_3F_7)]_n$, where M is a cation, m is at least 2 and n is at least 1.

25

9. A method of using the composition according to anyone of the previous claims as a surfactant, dispersant, leveling agent, emulsifier, or wetting agent.

30

10. A method for making an anionic fluorinated oligomer comprising i) the oligomerization of fluorinated olefinic monomer with a first functional group, wherein the first functional group can be converted into an anionic group; and ii) converting the first functional group into an anionic group, wherein the anionic group is selected from the group consisting of: sulfonate, sulfate, carboxylate, phosphonate, and phosphate.
