§ 371 (c)(1), Date: Oct. 6, 2015

ABSTRACT

The present invention provides a compound of Formula (I) or pharmaceutical acceptable thereof, wherein ‘R’ is herein described. In addition, the invention relates to composition comprising effective therapeutic amount of compound of formula (I) and methods of using the compounds for treating or prevention disorder such as nonalcoholic fatty liver disease (NAFLD) including fatty liver (steatosis), nonalcoholic steatohepatitis (NASH), and cirrhosis (advanced scarring of the liver).

A NOVEL COMPOSITION FOR NONALCOHOLIC FATTY LIVER DISEASE (NAFLD)

FIELD OF THE INVENTION

The present invention relates to pharmaceutical compositions containing the formula (I)

for the reduction and removal of lipid accumulated in the liver cells (hepatocytes) which is associated with nonalcoholic fatty liver disease (NAFLD). The present invention further provides the composition of formula (I) useful in the prevention and treatment of nonalcoholic fatty liver disease (NAFLD).

BACKGROUND OF THE INVENTION

Nonalcoholic fatty liver disease (NAFLD) refers to a wide spectrum of liver disease ranging from simple fatty liver (steatosis), to nonalcoholic steatohepatitis (NASH), to cirrhosis (irreversible, advanced scarring of the liver). All of the stages of NAFLD have in common the accumulation of fat (fatty infiltration) in the liver cells (hepatocytes). In NASH, the fat accumulation is associated with varying degrees of inflammation, fibrosis and scarring of the liver.

NASH and NAFLD are frequently reported in both men and women, although it most often appears in women and is especially prevalent in the obese. Although the disease has been observed to be accompanied by several other pathological conditions, including diabetes mellitus, hyperlipidemia, hyperglycemia, all part of the “metabolic syndrome,” the cause and progression of the disease, as well as the causal or temporal relation to these conditions, is not well understood.

However, in patients suffering from NAFLD and NASH in particular, certain characteristics of liver tissue and abnormalities of function are typical. Specifically, fatty deposits, tissue degeneration, inflammation, cell degeneration, fibrosis, cirrhosis, elevation of free fatty acids and other such abnormalities have come to be associated with nonalcoholic steatohepatitis and are frequently seen in patients suffering from different forms of NAFLD.

The physiological condition that most commonly accompanies NASH is obesity, with approximately 70% and above of NASH sufferers also displaying clinically diagnosed obesity. NASH is particularly prevalent in obese patients who have undergone jejunal bypass to treat the obesity. In NASH patients, the extent of obesity tends to be generally correlated with the amount of steatosis and to be unrelated to non-insulin-dependent diabetes mellitus. However, non-insulin-dependent diabetes mellitus increases the prevalence of steatohepatitis especially in patients requiring insulin.

Unless a massive amount of the excess body weight is eliminated, weight loss in patients before death does not appear to alleviate the steatosis and, somewhat paradoxically, obese patients who lost weight before death can have a higher incidence of steatohepatitis.

Even in NASH patients who do not consume any alcohol at all, liver biopsy specimens tend to mimic those seen in patients suffering from alcoholic hepatitis. However, a comparison of the two conditions reveals a higher incidence of vacuolation (indicative of diabetes) and steatosis in NASH as compared to alcoholic hepatitis. Patients suffering from alcoholic hepatitis also have a higher incidence of perportal and periportal fibrosis and proliferation of the bile ducts. Overall, the symptoms and histological damage observed in alcoholic hepatitis patients are more severe than in NASH.

Currently, there is no established therapy for patients suffering from NASH. Weight loss is a common prescription, simply because obesity is frequently detected in patients suffering from NASH. The effect of a reduction in weight loss on NASH cannot be determined with certainty, however, because obese patients seldom maintain significant weight reduction. Thus, there is a need to find a treatment for NAFLD and particularly NASH.

OBJECTS OF THE INVENTION

In one embodiment, the present invention discloses a pharmaceutical composition containing the compound of the Formula (I)

for reduction and removal of lipid accumulated in the liver cells (hepatocytes), required for treating and preventing certain diseases and conditions related to nonalcoholic fatty liver disease (NAFLD) including fatty liver (steatosis), nonalcoholic steatohepatitis (NASH), and cirrhosis (advanced scarring of the liver) in patient in need of such treatment.

In another embodiment the present invention provides a method and a formulation comprising an effective amount of compound of Formula (I) for treating nonalcoholic fatty liver disease (NAFLD) including fatty liver (steatosis), nonalcoholic steatohepatitis (NASH), and cirrhosis (advanced scarring of the liver).

The method comprises administering to a subject an effective amount of a compound of formula (I) as a pharma-
ceutical formulation, as disclosed hereinafter including pharmaceutically acceptable salts of the compound of formula (I).

In yet another embodiment the invention further provides a pharmaceutical composition containing effective amount of compound of formula (I) suitable for treatment of nonalcoholic fatty liver disease (NAFLD) including fatty liver (steatosis), nonalcoholic steatohepatitis (NASH), and cirrhosis (advanced scarring of the liver).

In another embodiment the present invention provides a method of treating alcoholic steatohepatitis in a subject, comprising administering to the subject an effective amount of a compound according to Formula (I), or a pharmaceutically acceptable salt thereof as a suitable pharmaceutically acceptable composition.

In another embodiment the present invention provides a method of treating liver failure in a subject, comprising administering to the subject an effective amount of a compound according to Formula (I), or a pharmaceutically acceptable salt thereof. The above and other embodiments of the present invention are disclosed further hereinafter.

DESCRIPTION OF THE FIGURES

FIG. 1: Effect of Saroglitazar on ALT in PP population

FIG. 2: Effect of Saroglitazar on liver function test in Safety Population

FIG. 3: Effect of Saroglitazar on C-Peptide and HOMA Function in PP population

FIG. 4: Effect of Saroglitazar on Triglycerides in PP population

DETAILED DESCRIPTION OF THE INVENTION

The present invention describes a pharmaceutical composition for reduction and removal of lipid accumulated in the liver cells (hepatocytes), required for treating and preventing certain diseases and conditions in subject suffering from nonalcoholic fatty liver disease (NAFLD) including fatty liver (steatosis), nonalcoholic steatohepatitis (NASH), and cirrhosis (advanced scarring of the liver) and methods for ameliorating and/or treating such disease conditions.

The formulation comprises compound of formula (I) and the method comprises administering to a subject in need thereof an effective amount of a compound according to Formula (I), or a pharmaceutically acceptable salt thereof.

wherein “R” is selected from hydroxy, hydroxalkyl, acyl, alkoxy, alkylthio, thioalkyl, arylthio and M represents suitable metal cations such as Na⁺, K⁺, Ca²⁺, Mg²⁺ and the like.

DEFINITIONS AND ABBREVIATIONS

As used above, and throughout this disclosure, the following terms, unless otherwise indicated, shall be understood to have the following meanings:

“Patient” includes both human and animals. “Mammal” means humans and other mammalian animals.

A “subject” is a mammal, preferably a human, but can also be an animal in need of veterinary treatment, e.g., companion animals (e.g., dogs, cats, and the like), farm animals (e.g., cows, sheep, pigs, horses, and the like) and laboratory animals (e.g., rats, mice, guinea pigs, and the like).

As used herein “treating” includes achieving, partially or substantially, one or more of the following results: partially or totally reducing the extent of the disease, disorder or syndrome (e.g., reducing liver deposits, increasing insulin activity/sensitivity, reducing weight); ameliorating or improving a clinical symptom or indicator associated with the disorder; delaying, inhibiting or preventing the progression of the disease, disorder or syndrome; or partially or totally delaying, inhibiting or preventing the onset or development of disorder. Delaying, inhibiting or preventing the progression of the disease, disorder or syndrome includes for example, delaying, inhibiting or preventing the progression of fatty liver to NASH; delaying, inhibiting or preventing the progression of NASH to cirrhosis, end-stage liver disease and/or hepatocellular carcinoma; and delaying, inhibiting or preventing the progression of pre-diabetes to diabetes.

The term “alkyl” used herein, either alone or in combination with other radicals, denotes a linear or branched radical containing one to twelve carbons, such as methyl, ethyl, n-propyl, iso-propyl, n-butyl, sec-butyl, tert-butyl, amyl, t-amyl, n-pentyl, n-hexyl, iso-hexyl, heptyl, octyl and the like.

The term “alkoxy” used herein, either alone or in combination with other radicals, denotes a radical alkyl, as defined above, attached directly to an oxygen atom, such as methoxy, ethoxy, n-propoxy, iso-propoxy, n-butoxy, t-butoxy, iso-butoxy, pentyloxy, hexyloxy, and the like.

The term “aryl” or “aromatic” used herein, either alone or in combination with other radicals, refers to an optionally substituted aromatic system containing one, two or three rings wherein such rings may be attached together in a pendant manner or may be fused, such as phenyl, naphthyl, triphenylmethyland indane, biphenyl, and the like. The term “aryl” denotes an aryl group, as defined above, attached to an aryl, such as benzyl, phenethyl, naphthyl, and the like. The term “aryloxy” denotes an aryl radical, as defined above, attached to an arloxy group, such as phenoxy, naphthoxy and the like, which may be substituted. The term “aryalkoxy” denotes an aryloalkoxy moiety, as defined above, such as benzyloxy, phenethyloxy, naphthylmethyloxy, phe- nylpropyloxy, and the like, which may be substituted.

The term “acyl” used herein, either alone or in combination with other radicals, refers to a radical containing one to eight carbons such as formyl, acetyl, propanoyl, butanoyl,
iso-butanoic, pentanoic, hexanoic, heptanoic, benzoyl and the like, which may be substituted.

The term “hydroxyalkyl” used herein, either alone or in combination with other radicals, refers to an alkyl group, as defined above, substituted with one or more hydroxy radicals, such as hydroxymethyl, hydroxyethyl, hydroxyproyl, hydroxybutyl, hydroxypentyl, hydroxyhexyl and the like.

0029 The term “thio(C1-C6)alkyl” or “thio(C1-C6)alkyl” used herein, either alone or in combination with other radicals, represents an alkyl group, as defined above, attached to a group of formula —SR, where R represents hydrogen, alkyl or aryl group, e.g. thiomethyl, methythiomethyl, phenythiomethyl and the like, which may be substituted.

Effective amount” or “therapeutically effective amount” is meant to describe an amount of compound or a composition of the present invention effective in inhibiting the abovementioned diseases and thus producing the desired therapeutic, ameliorative, inhibitory or preventative effect.

0030 One or more compounds of the invention may exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like, and it is intended that the invention embrace both solvated and unsolvated forms. “Solvate” means a physical association of a compound of this invention with one or more solvent molecules. This physical association involves varying degrees of ionic and covalent bonding, including hydrogen bonding. In certain instances the solvate will be capable of isolation, for example when one or more solvent molecules are incorporated in the crystal lattice of the crystalline solid. “Solvate” encompasses both solution-phase and isolatable solvates.

0031 One or more compounds of the invention may optionally be converted to a solvate. Preparation of solvates is generally known. Thus, for example, M. Cuira et al, J. Pharmaceutical Sci, 93(3), 601-611 (2004) describe the preparation of the solvates of the antifungal floconazole in ethyl acetate as well as from water. Similar preparations of solvates, hemisolvates, hydrates, and the like are described by E. C. van Tonder et al, AAPS PharmSciTech., 5(1), article 12 (2004); and A. L. Binghum et al, Chem. Commun., 603-604 (2001).

0032 The compounds of Formula (I) can form salts which are also within the scope of this invention. Reference to a compound of Formula (I) herein is understood to include reference to salts thereof, unless otherwise indicated. The term “salt(s)” as employed herein, denotes acidic salts formed with inorganic and/or organic acids, as well as basic salts formed with inorganic and/or organic bases. In addition, when a compound of Formula (I) contain both a basic moiety, such as, but not limited to a pyridine or imidazole, and an acidic moiety, such as, but not limited to a carboxylic acid, zwitterions (“inner salts”) may be formed and are also included within the term “salt(s)” as used herein.

0033 Pharmaceutically acceptable (i.e., non-toxic, physiologically acceptable) salts are preferred, although other salts are also useful. Salts of the compounds of the Formula (I) may be formed, for example, by reacting a compound of Formula I with an amount of acid or base, such as an equivalent amount, in a medium such as one in which the salt precipitates or in an aqueous medium followed by lyophilization.

0034 Exemplary acid addition salts include acetates, ascorbates, benzoates, benzenesulfonates, bisulfates, borates, butyrates, citrates, camphorates, camphorsulfonates, fumarates, hydrochlorides, hydrobromides, hydroiodides, lactates, maleates, methanesulfonates, naphthalenesulfonates, nitrates, oxalates, phosphates, propionates, salicylates, saccharinates, sulfates, tartarates, thiocyanates, toluenesulfonyl ests (also known as tosylates), and the like.

0035 Exemplary basic salts include ammonium salts, alkali metal salts such as sodium, lithium, and potassium salts, alkaline earth metal salts such as calcium and magnesium salts, salts with organic bases (for example, organic amines) such as diethylether diamines, t-butyl amines, and salts with amino acids such as arginine, lysine and the like. Basic nitrogen-containing groups may be quaternized with agents such as lower alkyl halides (e.g., methyl, ethyl, and butyl chlorides, bromides and iodides), dialkyl sulfates (e.g., dimethyl, diethyl, and dibutyl sulfates), long chain halides (e.g., decyl, lauryl, and stearyl chlorides, bromides and iodides), aralkyl halides (e.g., benzyl and phenethyl bromides), and others.

0036 All such acid salts and base salts are intended to be pharmaceutically acceptable salts within the scope of the invention and all acid and base salts are considered equivalent to the free forms of the corresponding compounds for purposes of the invention.

0037 Polymorphic forms of the compounds of Formula (I), and of the salts, solvates, esters and prodrugs of the compounds of Formula (I) are intended to be included in the present invention.

0038 As used herein, the term “composition” is intended to encompass a product comprising the specified ingredients in the specified amounts, as well as any product which results, directly or indirectly, from combination of the specified ingredients in the specified amounts.

0039 In the embodiments the present invention provides a suitable pharmaceutical composition of compounds of formula (I) or their derivatives, which comprises one or more pharmaceutical excipients, antioxidants and chelating agents, wherein the pH of the composition is above 6, preferably in the range from about pH 6 to pH 10.

0040 In such embodiments the pharmaceutical composition of the present invention essentially comprises of

0041 the pharmaceutically active substance;

0042 suitable additives;

0043 a suitable stabilizer;

0044 optionally with one or more pharmaceutically acceptable excipients.

One function of the liver is to process fats and proteins from digested food.

0045 Fatty liver disease covers a range of conditions where there is a build-up of fat in the liver cells. The liver cells (hepatocytes) normally contain some fat and related fatty chemicals (triglycerides, fatty acids, etc). Excess fat is normally passed out of liver cells, into the bloodstream, and taken up and stored in fat cells (adipose cells) throughout the body. In fatty liver disease, excess fat builds up in liver cells. This is thought to happen if there is some problem or disruption in the normal processing of fat and related fatty chemicals in the liver cells. Simple fatty liver (also called “hepatic steatosis”) is present when the fat content inside liver cells makes up more than 5-10% of the liver’s weight. Simple fatty liver is not associated with serious damage or harm to the liver.

0046 Nonalcoholic fatty liver disease (NAFLD) refers to a wide spectrum of liver disease ranging from: i) simple fatty liver (steatosis), in which there are fat deposits on the liver; ii) nonalcoholic steatohepatitis (NASH) in which there are fat deposits on the liver along with inflammation and damage of
the liver; and iii) cirrhosis in which there is irreversible, advanced scarring of the liver.

[0047] All of the stages of NAFLD have in common the accumulation of fat (fatty infiltration) in the liver cells (hepatocytes). Fatty liver (stevostosis) can progress to nonalcoholic steatohepatitis (NASH). In NASH, the fat accumulation is associated with varying degrees of inflammation and scarring of the liver, and in many cases insulin resistance, dyslipidemia and hypertension. NASH can progresses to fibrosis, steatohepatitis and may trigger cirrhosis, end-stage liver disease, acute liver failure and hepatocellular carcinoma. It most often occurs in people with excess body weight, elevated blood lipids, such as cholesterol and triglycerides, and insulin resistance.

[0048] The present invention also provides methods of treating liver failure. Acute liver failure occurs when the cells in the liver die or become damaged in a short period of time. This causes the liver to fail to work normally and can be fatal.

[0049] Any progressive liver disease, such as cirrhosis, can result in liver failure. Signs of liver failure include encephalopathy (altered brain function, jaundice, ascites, feto hepaticus and failure of coagulation).

[0050] Many people with simple fatty liver have other conditions where fatty liver is a complication. Many cases of simple fatty liver develop in people who drink more alcohol than the recommended limits. Over half of people who drink heavily develop simple fatty liver. In these cases simple fatty liver can progress to alcoholic steatohepatitis. In this condition the excess fat in the liver cells is associated with, or may cause, inflammation of the liver. Alcoholic steatohepatitis, may eventually cause scarring (cirrhosis) of the liver.

[0051] Effective amounts of such compounds are administered to a subject with one or more of these conditions.

[0052] In an embodiment the compounds according to Formula (1) can be used alone or in combination e.g., as an adjunct therapy, with at least one other therapeutic agent. Compounds according to formula (1) can be subject with NASH, a compound according to formula (1) can be co-administered with a therapeutic agent used to reduce one or more of the symptoms of NASH. In a method according to formula (1), but not limited to, an agent used to control blood glucose levels, an agent used to control lipid levels, e.g., an agent used to lower or control cholesterol, an antioxidant, an appetite suppressing agent, an anti-obesity agent, to control blood glucose levels, such as, sulfonylureas, an antibiotic/probiotic or an anti-inflammatory agent. Examples of such agents are listed herein and includes chlorpropamide, glipizide, glyburide, and glimepiride; meglitinides, such as, repaglinide and nateglinide; biguanides, such as, metformin and acarbose; thiazolidinediones, such as, rosiglitazone, and pioglitazone; and insulin and its derivatives, such as, pramlintide, exenatide, humalog, novolog, humulnia, novolin, ultralente, and lanus; an agent used to control lipid levels, such as, vytolin, Clofibrate and Gemfibrozil, a plasma HDL-raising agent, a cholesterol lowering agent, a cholesterol biosynthesis inhibitor, for example an HMG-CoA reductase inhibitor (such as a statin, such as, Atorvastatin, Fluvastatin, Lovastatin, Pravastatin, Rosuvastatin, Simvastatin); an HMG-CoA synthase inhibitor, an acyl-coenzyme A: cholesterol acyltransferase (ACAT) inhibitor, such as, melaminide; probucol, niacin (nicotinic acid, Vitamin-B-3), nicotinic acid and the salts thereof and niacinamide: a cholesterol absorption inhibitor such as ezetimibe; a bile acid sequestrant, such as, cholestyramine, colestipol, and Colesevelam; lipids such as clofibrate, fenofibrate, and gemfibrozil, vitamin B6 (also known as pyridoxine) and physiologically acceptable salts thereof, such as the HCl salt; vitamin B12 (also known as cyanocobalamin), and angiotensin II antagonist converting enzyme inhibitor; a beta-blocker; an agent used to reduce weight or suppress appetite, such as, sibutramine, orlistat and the like.

[0053] In an embodiment, when methods of the present invention are used to treat a subject with alcoholic steatohepatitis, a compound according to formula (1) can be co-administered with a therapeutic agent used to reduce one or more of the symptoms of alcoholic steatohepatitis including, but not limited to, an agent used to control blood glucose levels, an agent used to control lipid levels, e.g., an agent used to lower control cholesterol, an antioxidant, an appetite suppressing agent, an anti-obesity agent, an antibiotic or an anti-inflammatory agent, such as those described above.

[0054] In another embodiment when methods of the present invention are used to treat a subject with liver failure, a compound according to formula (1) can be co-administered with a therapeutic agent used to reduce one or more of the symptoms of alcoholic steatohepatitis including, but not limited to, an agent used to control blood glucose levels, an agent used to control lipid levels, such as those described above.

[0055] In a further embodiment, the present invention disclosed a suitable pharmaceutical composition of the compound of formula (1), for the treatment of one or more of the diseases disclosed above. A preferred pharmaceutical composition of the compound of formula (1) comprises of

[0056] the pharmaceutically active substance;

[0057] Suitable additives;

[0058] a suitable stabilizer;

[0059] optionally with one or more pharmaceutically acceptable excipients.

Each of the components may be selected from those known in the art.

[0060] In an embodiment suitable stabilizers may be selected from the classes of antioxidants or chelating agents.

[0061] In an embodiment the pharmaceutical excipients according to the present invention can be selected from solubilizers, diluents, fillers, disintegrants, binders, lubricants, glidants, wetting agents, solvents and the like as is known in the art.

[0062] In an embodiment suitable additives are selected from sodium benzoate, sodium hydroxide, sodium sulfate and sodium carbonate.

[0063] In an embodiment antioxidants used according to the present invention include, but are not limited to citric acid, alpha tocopherol, sodium sulphite, sodium metabisulphite, butylated hydroxy anisole (BHA), BHT (2,6-di-tert-butyl-4-methylphenol), monothioglycerol, Vitamin C (ascorbic acid), and propyl gallate and combinations thereof and other similar material known to those of ordinary skill in the art.

[0064] Chelating agent used according to the present invention include, but are not limited to Disodium EDTA, citric acid and or its salts, maleic acid, chlorambutol, chlorohexidine or its salts, chlororoesol, combinations thereof and other similar material known to those of ordinary skill in the art.

[0065] As used herein, the term "binders" is intended to mean substances used to cause adhesion of powder particles in tablet granulations. Such compounds include, by way of example and without limitation, acacia alginic acid, tragacanth, carboxymethylcellulose sodium, poly (vinylpyrrolidone), compressible sugar (e.g., NuTab), ethylcellulose, gela-
tin, liquid glucose, methyl cellulose, povidone and pregelatinized starch, combinations thereof and other similar material known to those of ordinary skill in the art.

When needed, other binders may also be included in the present invention. Exemplary binders include starch, poly (ethylene glycol), guar gum, polysaccharide, bentonites, sugars, invert sugars, poloxamers (PLURONIC F68, PLURONIC F127), collagen, albumin, celluloses in non-aqueous solvents, and the like or their suitable combinations. Other binders which may be included may be, for example, poly (propylene glycol), polyoxyethylene-polypropylene copolymer, polyethylene ester, polyethylene sorbitan ester, poly (ethylene oxide), microcrystalline cellulose, poly (vinylpyrrolidone), combinations thereof and other such materials known to those of ordinary skill in the art.

As used herein, the term “diluent” or “filler” is intended to mean inert substances used as fillers to create the desired bulk, flow properties, and compression characteristics in the preparation of tablets and capsules. Such compounds include, by way of example and without limitation, dibasic calcium phosphate, kaolin, sucrose, mannitol, microcrystalline cellulose, powdered cellulose, precipitated calcium carbonate, sorbitol, starch, combinations thereof and other such materials known to those of ordinary skill in the art.

As used herein, the term “glidant” is intended to mean agents used in tablet and capsule formulations to improve flow-properties during tablet compression and to produce an anti-caking effect. Such compounds include, by way of example and without limitation, colloidal silica, calcium silicate, magnesium silicate, silicon hydrogel, cornstarch, talc, combinations thereof and other such materials known to those of ordinary skill in the art.

In an embodiment, the term “lubricant” is intended to mean substances used in tablet formulations to reduce friction during tablet compression. Such compounds include, by way of example and without limitation, calcium stearate, magnesium stearate, mineral oil, stearic acid, zinc stearate, suitable combinations thereof and other such materials known to those of ordinary skill in the art.

In an embodiment, the term “disintegrant” is intended to mean a compound used in solid dosage forms to promote the disruption of the solid mass into smaller particles which are more readily dispersed or dissolved. Exemplary disintegrants include, by way of example and without limitation, starches such as corn starch, potato starch, pregelatinized and modified starches thereof, sweeteners, clays, such as bentonite, microcrystalline cellulose (e.g., Avicel™), car- sium (e.g., Amberlite™), alginates, sodium starch glycoblate, gums such as agar, guar, locust bean, karaya, pectin, tragacanth, combinations thereof and other such materials known to those of ordinary skill in the art.

In an embodiment, the term “wetting agent” is intended to mean a compound used to aid in attaining intimate contact between solid particles and liquids. Exemplary wetting agents include, by way of example and without limitation, poloxamers, gelatin, casein, Glycerol mono-oleate, lecithin (phosphatides), gum acacia, cholesterol, tragacanth, stearic acid, benzalkonium chloride, calcium stearate, glycerol monostearate, cetostearyl alcohol, sodium lauryl sulfate, sodium dodecyl sulfate, salts of bile acids (taurocholate, glycocholate, cholate, deoxycholate, etc.), cetomacrogol emulsifying wax, sorbitan esters, polyoxyethylene alkyl ethers (e.g., macrogol ethers such as cetomacrogol 1000), polyoxyethylene castor oil derivatives, polyoxyethylene sorbitan fatty acid esters, (e.g., TWEEN), polyethylene glycols, polyoxyethylene stearamides colloidal silicon dioxide, phosphates, sodium dodecyl sulfate, carboxymethyl cellulose calcium, carboxy methylcellulosesodium, methyl cellulose, hydroxyethyl cellulose, hydroxypropylcellulose, hydroxypropyl methyl cellulose, pthalalate, noncrystalline cellulose, magnesium aluminum silicate, triethanolamine, polyvinyl alcohol, and polyvinyl pyrrolidone (PVP) and their suitable combinations and other such materials known to those of ordinary skill in the art. Tyloxapol (a nonionic liquid polymer of the alkyl aryl polyether alcohol type, also known as superoin or triton) is another useful wetting agent which may be used. The stable pharmaceutical composition according to the present invention may be in the form of tablet or capsule or a powder or a suspension in a liquid or an aerosol formulation or solutions, preferably in the form of tablet or capsule.

In another embodiment of the present invention, is a described process for the preparation of a stable pharmaceutical composition of compounds of formula (I) or their derivatives.

The stable pharmaceutical composition may be made by direct compression, wet granulation or dry granulation methods by techniques known to persons skilled in the art. Thus, for example, in wet granulation process, the drug is mixed with one or more pharmaceutical excipients and granulated with suitable binding solution as described earlier, to form wet granules, the wet granules are dried and optionally sieved. The dried granules are mixed with one or more suitable excipients from those described elsewhere and then compressed into tablets or filled into capsules.

In direct compression process, the drug is mixed with all the pharmaceutical excipients required and then is either compressed into tablets or filled into capsules.

In dry granulation process the drug is mixed with one or more pharmaceutical excipients and compressed into slugs and these slugs are passed through required sieves. The sieved granules are mixed with one or more suitable excipients from those described elsewhere and then compressed into tablets or filled into capsules.

One or more solvents used in the formulation are selected from acetone, chloroform, dichloromethane, ethyl alcohol, ethyl acetate, methyl alcohol, isopropyl alcohol and combinations thereof and other such materials known to those of ordinary skill in the art.

In an embodiment, the compound of formula (I) or pharmaceutical compositions containing the compound of formula (I) is given to a subject in need thereof at a dose of about 0.5 mg to 5 g. A skilled person is aware how to decide the optimum dose based on the patient profile, the severity of disease, the presence of secondary medicines and the like.

The compound of formula (I), when R is —SMR and M⁺ is Mg, is commercially known as Saroglitazar. This compound (Saroglitazar) is dosed in patients in need thereof for the treatment of one or more of the diseases described above as per the following general protocol:

Study Design and Protocol:

Title of the Study—"A prospective, multi-centric, open-label, single arm study to evaluate the safety and efficacy of 4 mg of Saroglitazar in a pharmaceutical composition as described above in Non-alcoholic steatohepatitis."
Objectives:

To evaluate the safety and efficacy of 4 mg of compound of Saroglitazar in Non-alcoholic steatohepatitis (NASH).

The Following Efficacy Parameters were Measured:

Primary Efficacy (Time Frame 6 and 12 Weeks):

1. Change in alanine aminotransferase (ALT) from baseline

Secondary Efficacy (Time Frame 6 and 12 Weeks):

Sustained reduction in ALT level.

C-peptide test for homeostasis model assessment (HOMA) beta and HOMA IR

Triglyceride (TG)

Criteria for Safety:

1. General and Systemic Clinical Examination: Cardiovascular system (CVS), respiratory system (RS), gastro-intestinal system (GIS), central nervous system (CNS) etc.

2. Laboratory Investigations: Complete blood count (CBC), aspartate aminotransferase (AST), ALT, alkaline phosphatase (ALP), serum bilirubin, γ-glutamyl transpeptidase (GGT), Serum proteins, blood urea nitrogen (BUN), Serum creatinine, creatinine phosphokinase (CPK), fasting plasma glucose (FPG).

3. Frequency and severity of adverse events (AEs) for all subjects enrolled were recorded. All AEs were classified using:

- causality
- severity
- seriousness

Methodology:

It is an interventional, single arm, safety and efficacy study to explore effect of compound of Saroglitazar suitably formulated as described above, on NASH.

Subjects was diagnosed by biopsy as suffering from NASH in last one year and willing to participate in study were invited for screening programme for inclusion in the study. Subjects satisfying inclusion exclusion criteria will be enrolled in the study.

All subjects were given suitable formulation of compound of Saroglitazar 4 mg for 12 weeks. Lifestyle modification was continued as before the study. Patient was monitored for safety and efficacy of Saroglitazar.

Study Schedules:

Informed consent was obtained before any trial related activity.

Visit 1, Screening Visit/Enrolment [Week –1 to 0]

Subjects were screened for the inclusion and exclusion criteria and those qualifying were invited to participate in the study. Clinical evaluation was done for baseline characteristics and anthropometry.

After Clinical evaluations, all baseline safety and efficacy parameters were recorded as per Table (I) given below. All laboratory investigations were carried out after overnight fasting.

During the 12 week program, a designated person from the centre could interview the subjects for his/her general health, telephonically.

Enrolled Subjects would receive the study medication for next two weeks.

Patients were advised to follow same lifestyle modifications during study period as before the study.

Subjects were clinically examined and given the study medications for four weeks and also safety parameters were assessed as per Table (I) given below.

Subjects were clinically examined and given the study medications for next 6 weeks.

Safety and efficacy parameters were assessed as per Table (I) given below.

Visit 4 [Week 12]

Subjects were clinically examined and safety and efficacy parameters were assessed as per Table (I) given below.

If further investigations are required in case of any AE, investigator will be advised to assess the AE and take necessary action, if required. Subjects will be advised to contact the investigator for any complaints within next two weeks.

During the above period, if any subject misses the drug administration up to 3 consecutive days, it will not be considered drop-out or protocol deviation.

Study Completion

*Laboratory Tests:

Biochemistry (laboratory) parameters to be performed include following tests:

Liver Function test (LFT): AST, ALT, ALP, total bilirubin, serum proteins, total albumin and globulin; GGT

Renal function test: Blood urea nitrogen (BUN), Serum creatinine and calculated GFR

Creatinine phosphokinase (CPK)

CBC
Criteria for Inclusion/Exclusion:

Inclusion Criteria:

- Subject has given informed consent for participation in this trial
- Biopsy proven NASH (Biopsy done in last one year).
- ALT > 1.5 times upper normal limit.
- Patient presently on lifestyle modification for NASH for at least one month.
- BMI between 23 to 40 kg/m²
- Compensated liver disease with the following hematologic, biochemical, and serological criteria on entry into protocol:
  - Hemoglobin >9 g/dL
  - White blood cell (WBC) > 2.5 K/UL
  - Neutrophil count > 1.5 K/UL
  - Platelets > 100 K/UL
  - Serum bilirubin, < 1.5 mg %
  - Albumin > 3.2 g/dL
  - Serum creatinine within normal limits

Exclusion Criteria:

- Pregnancy and lactation
- Subjects with history of gall stone
- Subjects with history of myopathies or evidence of active muscle diseases
- Subject with history of alcohol consumption > 20 gm/week and/or drug abuse
- Known allergy, sensitivity or intolerance to the study drugs and their formulation ingredients
- Participation in any other clinical trial in past 3 months
- History of malignancy; active neoplasm.
- Previous liver biopsy that demonstrated presence of cirrhosis or radiologic imaging consistent with cirrhosis or portal hypertension.
- Type 2 diabetes treated with agents other than the secretagogues (these include, insulin thiazolidinediones, alpha-glucosidase inhibitors, exenatide, pramlintide). Metformin will be allowed provided dose is stable science last 6 months.
- Evidence of poorly-controlled diabetes [glycosylated hemoglobin (HbA1c) > 9%].
- Type 1 diabetes mellitus.
- Abnormal PT/INR (Prothrombin Time/International normalized ratio)
- Patient on fibrates (Other antidyslipidemic drugs will be allowed provided dose is stable in last 6 months)
- Use of drugs associated with a clinical or historical picture consistent with fatty liver disease or NASH for more than 12 consecutive weeks in the 1 year prior to start of the study; (these include amiodarone, tamoxifen, methotrexate, glucocorticoids, anabolic steroids, tetracyclines, estrogens, valproate/valproic acid, chloroquine, anti-HIV drugs etc.)
- History of thyroid disease poorly controlled on prescribed medications
- History of, or current cardiac dysrhythmias and/or a history of cardiovascular disease, including myocardial infarction, except patients with only well controlled hypertension.

[0136] History of bariatric surgery, or undergoing evaluation for bariatric surgery.

[0137] History or other evidence of severe illness or any other conditions that would make the patient, in the opinion of the investigator, unsuitable for the study (such as poorly controlled psychiatric disease, coronary artery disease, or active gastrointestinal conditions that might interfere with drug absorption).

[0138] Subject on any treatment with other drugs claimed for treatment of NASH (Pentoxifylline, Ursodeoxycholic acid, acetyl cholinesterase enzyme (ACE) inhibitors antioxidants such as vitamin E, vitamin C, glutathione, alpha-tocopherol, or non-prescribed complementary alternative medications (including dietary supplements, megadose vitamins, herbal preparations, and special teas.) or any medicine in clinical trials for NASH.

[0139] Other cause of chronic liver disease [autoimmune, primary biliary cirrhosis, hepatitis B virus (HBV), Wilson, alpha-1-antitrypsin deficit, hemochromatosis etc.]. Anti-nuclear antibodies (ANA) > 1:160, Anti-smooth muscle Ab positive > 1:160, Serum hepatitis B surface antigen (HBsAg) positive, Serum hepatitis C antibody (HepC Ab) positive, transferrin saturation > 45%.

Results

[0140] Subjects were screened for inclusion in the study after obtaining informed consent, out of which 32 subjects were enrolled into the study. Out of these 32 subjects, 29 subjects completed the study.

The effect of Saroglitriza at week 12 on various parameters of liver function is as follows.

- There was statistically significant reduction in the ALT levels from baseline in Saroglitriza 4 mg treatment group in the PP population at visit 3 and visit 4. (FIG. 1)
- There was sustained reduction in ALT levels 63.16% and 78.95% of patients at visit 3 and visit 4 respectively as per PP.
- Saroglitrza showed a statistical significant decrease in the Aspartate Transaminase, gamma-glutamyl transpeptidase and alkaline phosphatase at Week 3 and at Week 4 in the Safety Population. (FIG. 2)
- There was a non-significant change in the C peptide levels in Saroglitriza 4 mg at 6 and 12 weeks as per PP analysis and non-statistically significant reduction in HOMA—Beta cell function, HOMA—Insulin Resistance. (FIG. 3)
- Baseline TG<150 mg/dl—There was decrease in triglyceride in Saroglitrza 4 mg at week 12 as compared to baseline but it was not statistically significant in the PP population. (FIG. 4)
- Baseline TG>150 mg/dl—While decrease was observed in serum triglycerides at week 6 and 12 as compared to baseline but it was not statistically significant in Saroglitrza 4 mg in PP population. (FIG. 4)

Safety Conclusion:

Overall, Saroglitrza 4 mg was safe and well tolerated.

[0147] There were no deaths or SAEs reported in the Saroglitrza 4 mg treatment arm.

[0148] The overall incidence of AEs was Nil.

[0149] There were no persistent changes from baseline in various laboratory parameters. Few events of raised creatinine and five events of raised CPK value were
reported during the study. These events were mild and none of these events were considered clinically significant by the investigator.

[0150] There was no significant change in weight in Saroglitazar 4 mg group in NASH patients at visit 2, 3 and 4 visits compared to baseline.

[0151] Thus, the compounds of the present invention and the pharmaceutical composition as described in the specification are suitable for reduction and removal of lipid accumulated in the liver cells (hepatocytes) for the treatment of Nonalcoholic fatty liver disease (NAFLD) which refers to a wide spectrum of liver diseases ranging from simple fatty liver (steatosis) to nonalcoholic steatohepatitis (NASH).

1. A pharmaceutical composition comprising
(a) a pharmaceutically active substance of Formula (I);

\[
\begin{align*}
\text{CH}_3 \quad &\quad \text{O} \quad \text{O} \quad \text{O} \quad \text{M}^+ \\
\text{R} \quad &\quad \text{O} \quad \text{O} \quad \text{O} \quad \text{O}
\end{align*}
\]

wherein ‘R’ is selected from hydroxy, hydroxyalkyl, acyl, alkoxy, alkylthio, thioalkyl, aryloxy, arylthio and M* represents suitable metal cations selected from Na+, K+, Ca²⁺, Mg²⁺.

(b) suitable additives
(c) a suitable stabilizer;
(d) optionally one or more pharmaceutically acceptable excipients for the treatment of nonalcoholic fatty liver disease (NAFLD).

2. The pharmaceutical composition as claimed in claim 1 used for the reduction and removal of lipid accumulated in the liver cells (hepatocytes).

3. The pharmaceutical composition of claim 1 for the prevention and/or reducing/ameliorating the conditions associated with non-alcoholic fatty liver disease (NAFLD) including fatty liver (steatosis), non-alcoholic steatohepatitis (NASH), and cirrhosis (advanced scarring of the liver).

4. The pharmaceutical composition of claim 3 wherein the disease condition is fatty liver (steatosis).

5. The pharmaceutical composition of claim 3 wherein the disease condition is non-alcoholic steatohepatitis (NASH).

6. The pharmaceutical composition of claim 3 wherein the disease condition is cirrhosis.

7. The pharmaceutical composition as claimed in claim 1 wherein the suitable stabilizer is selected from antioxidants or chelating agents.

8. The pharmaceutical composition as claimed in claim 7 wherein the suitable antioxidants are selected from citric acid, alpha tocopherol, sodium sulphite, sodium metabisulphite, butylated hydroxy anisole (BHA), BHT (2,6-di-tert-butyl-4-methylphenol), monothioglycerol, Vitamin C (ascorbic acid).

9. The pharmaceutical composition as claimed in claim 7 wherein the suitable chelating agents are selected from Disodium EDTA, citric acid and/or its salts, maleic acid, chlorambucil, chlorhexidine.

10. The pharmaceutical composition as claimed in claim 1 wherein pharmaceutically active substance of Formula (I) is used in the range of 0.5 mg to 5 g.

11. The pharmaceutical composition as claimed in claim 1 wherein the suitable excipients are selected from solubilizers, diluents, fillers, disintegrants, binder, lubricants, glidants, wetting agents and solvents.

12. The pharmaceutical composition as claimed in claim 1 wherein the suitable additives are selected from sodium benzoate, sodium hydroxide, sodium sulfite and sodium carbonate.

13. The pharmaceutical composition as claimed in claim 1 wherein the suitable binders are selected from acacia algic acid, tragacanth, carboxymethylcellulose sodium, poly(vinylpyrrolidone), compressible sugar (e.g., NuTab), ethylcellulose, gelatin, liquid glucose, methyl cellulose, povidone and pregelatinized starch, combinations thereof; poly(ethylene glycol), guar gum, polysaccharide, bentonites, sugars, invert sugars, poloxamers (PLURONIC F68, PLURONIC F127), collagen, albumin, cellulosates in nonaqueous solvents, and the like or their suitable combinations; poly(propylene glycol), polyoxyethylene-polypropylene copolymer, polyethylene ester, polyethylene sorbitan ester, poly(ethylene oxide), microcrystalline cellulose, poly(vinylpyrrolidone).

14. The pharmaceutical composition as claimed in claim 1 wherein the suitable glidants selected from glicolosidal silica, calcium silicate, magnesium silicate, silicon hydrogel, corn starch and talc.

15. The pharmaceutical composition as claimed in claim 1 wherein the suitable glidants selected from calcium stearate, magnesium stearate, mineral oil, stearic acid, zinc stearate.

16. The pharmaceutical composition as claimed in claim 1 wherein the suitable lubricants are selected from calcium stearate, magnesium stearate, mineral oil, stearic acid and zinc stearate.

17. The pharmaceutical composition as claimed in claim 1 wherein the suitable disintegrant are selected from starches such as corn starch, potato starch, pre-gelatinized and modified starches, sweeteners, clays, microcrystalline cellulose, carusium, alginates, sodium starch glycolate, gums, guar, locust bean curara, pectin, tragacanth.

18. The pharmaceutical composition as claimed in claim 1 wherein the suitable wetting agent are selected from poloxamers, gelatin, casein, Glicerol mono-oleate, lecithin (phosphatides), gum acacia, cholesterol, tragacanth, stearic acids, benzalkonium chloride, calcium stearate, glycero monostearate, cetostearyl alcohol, sodium laure sulphate, sodium dodecyl sulfate, salts of bile acids, cetoconacrol emulsifying wax, sorbitan esters, polyoxyethylene alkyl ethers, polyoxyethylene castor oil derivatives, polyoxyethylene sorbitan fatty acid esters, polyethylene glycol, polyoxyethylene stearates, colloidal silicon dioxide, phosphates, sodium dodecylsulfate, carboxymethylcellulose calcium, carboxy methylcellulose, sodium methyl cellulose, hydroxyethyl cellulose, hydroxypropyl cellulose, hydroxy propyl methyl cellulose pthalate, noncrystalline cellulose, magnesium aluminum silicate, triethanolamine, polyvinyl alcohol, and poly vinyl pyrrolidone.

19. The composition as claimed in claim 1 is formulated in tablet or capsule forms.
20. The composition as claimed in claim 1 wherein the pH is maintained in the range of 6 to 10.

21. The compound as claimed in claim 1 wherein R is —SMe and M⁺ is Mg⁺².

22. The compound of claim 1 is magnesium salt of compound of formula (I) wherein R is —SMe.

23. A method of treating and/or ameliorating nonalcoholic fatty liver disease (NAFLD) by treating a patient the composition as claimed in claim 1.

24. The method as claimed in claim 23, wherein the disease condition includes fatty liver (steatosis), non-alcoholic steatohepatitis (NASH), and cirrhosis of the liver.

25. The method as claimed in claim 23 wherein the composition comprises compound of formula (I) wherein M is —SMe and M⁺ is Mg⁺².

26. Use of the composition of claim 1 for the treatment of non-alcoholic fatty liver disease (NAFLD).
