The compounds (I) can be present as salts, in particular pharmaceutically acceptable salts. If the compounds (I) have, for example, at least one basic centre, they can form acid addition salts. The compounds (I) having at least one acid group can also form salts with bases. Salts which are unsuitable for pharmaceutical uses but which can be employed, for example, for the isolation or purification of free compounds (I) or their pharmaceutically acceptable salts, are also included. In view of the close relationship between the novel compound in the free form and in the form of its salts, in the preceding text and below the free compound or its salts may correspondingly and advantageously also be understood as meaning the corresponding salts or the free compound.
Salts are especially the pharmaceutically acceptable salts of compounds of formula (I) or generally salts of any of the intermediates mentioned herein, where salts are not excluded for chemical reasons the skilled person will readily understand. They can be formed where salt forming groups, such as basic or acidic groups, are present that can exist in dissociated form at least partially, e.g. in a pH range from 4 to 10 in aqueous solutions, or can be isolated especially in solid, especially crystalline, form.

Such salts are formed, for example, as base addition salts, preferably with organic or inorganic bases, from compounds of formula (I) or any of the intermediates mentioned herein with an acidic carboxy group, especially the pharmaceutically acceptable salts. Suitable metal ions from inorganic bases are, for example, alkaline or alkaline earth metals, such as sodium, potassium, magnesium or calcium salts. Suitable organic bases are, for example, or ammonium salts with ammonia or suitable organic amines, such as tertiary monoamines, for example triethylamine or tri(2-hydroxyethyl)amine, or heterocyclic bases, for example N-ethyl-piperidine or N,N'-dimethylpiperazine.

In the presence of positively charged radicals, such as amino, salts may also be formed with acids. Such salts are formed, for example, as acid addition salts, preferably with organic or inorganic acids. Suitable inorganic acids are, for example, halogen acids, such as hydrochloric acid, sulfuric acid, or phosphoric acid. Suitable organic acids are, for example, carboxylic, phosphonic, sulfonic or sulfamic acids, for example acetic acid, propionic acid, lactic acid, fumaric acid, succinic acid, citric acid, amino acids, such as glutamic acid or aspartic acid, maleic acid, hydroxymaleic acid, methylmaleic acid, benzoic acid, methane- or ethane-sulfonic acid, ethane-1,2-disulfonic acid, benzenesulfonic acid, 2-naphthalenesulfonic acid, 1,5-naphthalene-disulfonic acid, N-cyclohexylsulfamic acid, N-methyl-, N-ethyl- or N-propyl-sulfamic acid, or other organic protonic acids, such as ascorbic acid.

When a basic group and an acid group are present in the same molecule, a compound of formula (I) or any of the intermediates mentioned herein may also form internal salts.

For isolation or purification purposes of compounds of the formula (I) or in general for any of the intermediates mentioned herein it is also possible to use pharmaceutically unacceptable salts, for example picrates or perchlorates. For therapeutic use, only pharmaceutically acceptable salts or free compounds of the formula (I) are employed (where applicable
comprised in pharmaceutical preparations), and these are therefore preferred at least in the case of compounds of the formula (I).

In view of the close relationship between the compounds and intermediates in free form and in the form of their salts, including those salts that can be used as intermediates, for example in the purification or identification of the compounds or salts thereof, any reference to "compounds", "starting materials" and "intermediates" hereinbefore and hereinafter, especially to the compound(s) of the formula (I), is to be understood as referring also to one or more salts thereof or a mixture of a corresponding free compound, intermediate or starting material and one or more salts thereof, each of which is intended to include also any solvate, metabolic precursor such as ester or amide of the compound of formula (I), or salt of any one or more of these, as appropriate and expedient and if not explicitly mentioned otherwise. Different crystal forms may be obtainable and then are also included.

Extensive pharmacological investigations have shown that cholesteryl ester transfer protein inhibitors, in particular the compounds I and their pharmaceutically acceptable salts, for example, have pronounced selectivity in inhibiting CETP (cholesteryl ester transfer protein). CETP is involved in the metabolism of any lipoprotein in living organisms, and has a major role in the reverse cholesterol transfer system. Namely, CETP has drawn attention as a mechanism for preventing accumulation of cholesterol in peripheral cells and preventing arteriosclerosis. In fact, with regard to HDL having an important role in this reverse cholesterol transfer system, a number of epidemiological researches have shown that a decrease in CE (cholesteryl ester) of HDL in blood is one of the risk factors of coronary artery diseases. It has been also clarified that the CETP activity varies depending on the animal species, wherein arteriosclerosis due to cholesterol-loading is hardly induced in animals with lower activity, and in reverse, easily induced in animals with higher activity, and that hyper-HDL-emia and hypo-LDL (low density lipoprotein)-emia are induced in the case of CETP deficiency, thus rendering the development of arteriosclerosis difficult, which in turn led to the recognition of the significance of blood HDL, as well as significance of CETP that mediates transfer of CE in HDL into blood LDL. While many attempts have been made in recent years to develop a drug that inhibits such activity of CETP, a compound having a satisfactory activity has not been developed yet.

The CETP inhibitory effect of the compounds of the present invention can be demonstrated by using test models know by a person skilled in the pertinent art, for example, following test models:

1) Preparation of human pro-apolipoprotein AI (pro-apoAI)

The cDNA of human pro-apoAI (NCBI accession number: NM_000039) is cloned from human liver Quick-Clone™ cDNA (Clontech, CA) and inserted to a pET28a vector (Novagen, Germany) for bacterial expression. Expressed protein as a fusion protein with 6xHis-tag at N-
terminus in BL-21 Gold (DE3) (Strategene, CA) is purified using HiTrap Chelating (GE Healthcare, CT).

(2) Preparation of donor microemulsion

Pro-apoAI containing microemulsion as a donor particle is prepared following previous reports (J. Biol. Chem., 280:14918-22). Glyceryl trioleate (62.5 ng, Sigma, MO), 3-sn-phosphatidylcholine (583 ng, Wako Pure Chemical Industries, Japan), and cholesteryl BODIPY® FL Cl₂ (250 ng, Invitrogen, CA) are dissolved in 1 ml of chloroform. The solution is evaporated, then residual solvent is removed in vacuum for more than 1 hr. The dried lipid mixture is dissolved in 500 μL of the assay buffer (50 mM Tris-HCl (pH 7.4) containing 150 mM NaCl and 2 mM EDTA) and sonicated at 50 °C with a microtip (MICROSON™ ULTRASONIC CELL DISRUPTOR, Misonix, Farmingdale, NY) at output power 006 for 2 min. After sonication, the solution is cooled to 40 °C, added to 100 μg of human pro-apoAI, and sonicated at output power 004 for 5 min at 40 °C. The solution, BODIPY-CE microemulsion as a donor molecule is stored at 4 °C after filtration through a 0.45 μm PVDF filter.

(3) In vitro CETP activity assay in human plasma

Human EDTA plasma samples from healthy men are purchased from New Drug Development Research Center, Inc. Donor solution is prepared by a dilution of donor microemulsion with assay buffer. Human plasma (50 μL), assay buffer (35 μL) and test compound dissolved in dimethylsulfoxide (1 μL) are added to each well of 96 well half area black flat bottom plate. The reaction is started by the addition of donor solution (14 μL) into each well. Fluorescence intensities are measured every 30 min at 37 °C with excitation wavelength of 485 nm and emission wavelength of 535 nm. The CETP activity (FI/min) is defined as the changes of fluorescence intensity from 30 to 90 min. The IC₅₀ value is obtained by the logistic equation (Y=Bottom + (Top-Bottom)/(1+(x/IC₅₀)^Hill slope) using Origin software, version 7.5 SR3. The compounds of formula I exhibit inhibitory activity with an IC₅₀ value in the range from approximately from 0.001 to 100 μM, especially from 0.01 to 10 μM.

(4) Effects on plasma HDL levels in hamster

Effects of compounds on HDL-cholesterol level in hamsters are investigated by the method reported previously with some modifications (Eur. J. Pharmacol., 466 (2003) 147-154). In brief, male Syrian hamsters (SLC, Shizuoka, Japan) are fed a high cholesterol diet for two
weeks. Then, the animals are dosed singly with the compound suspended with carboxyl methyl cellulose solution. HDL-cholesterol levels are measured by using commercially available kit (Wako Pure Chemical, Japan) after the precipitation of apolipoprotein B (apoB)-containing lipoproteins with 13% polyethylene glycol 6000. The compounds elevate greater than 5% of the HDL-cholesterol level compared with control.

The compounds of the present invention or a pharmaceutically acceptable salt thereof have superior CETP inhibitory activity in mammals (e.g., human, monkey, bovine, horse, dog, cat, rabbit, and the like), and can be used as CETP activity inhibitors. In addition, utilizing the superior CETP inhibitory activity of a compound of the present invention or a pharmaceutically acceptable salt thereof, the compounds of the present invention are useful as pharmaceutical agents effective for the prophylaxis or treatment of or delay progression to overt to diseases in which CETP is involved (e.g., hyperlipidemia, arteriosclerosis, atherosclerosis, peripheral vascular disease, dyslipidemia, hyperbetalipoproteinemia, hypoalphalipoproteinemia, hypercholesterolemia, hypertriglyceridemia, familial hypercholesterolemia, cardiovascular disorder, coronary heart disease, coronary artery disease, coronary vascular disease, angina, ischemia, heart ischemia, thrombosis, cardiac infarction such as myocardial infarction, stroke, peripheral vascular disease, reperfusion injury, angioplasty restenosis, hypertension, congestive heart failure, diabetes such as type II diabetes mellitus, diabetic vascular complications, obesity or endotoxemia etc.), particularly as prophylactic or therapeutic agents for hyperlipidemia or arteriosclerotic diseases and also for the treatment of infection (or egg embryonation) of schistosoma.

A further aspect of the present invention is the use of a CETP inhibitor for the prophylaxis or treatment of or delay progression to overt to a disease selected from the group consisting of coronary heart disease, coronary artery disease, coronary vascular disease, myocardial infarction, stroke, peripheral vascular disease, diabetes such as type II diabetes mellitus, congestive heart failure, and reperfusion injury.

Box II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. \[Claim Nos\] because they relate to subject matter not required to be searched by this Authority namely:

   Although claim 14 is directed to a method of treatment of the human/animal body, the search has been earned out and based on the alleged effects of the compound/composition.

2. \[Claim Nos\] because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be earned out specifically.

3. \[Claim Nos\] because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.

2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. As only some of the required additional search fees were timely paid by the applicant, this International Search Report...

4. No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims, it is covered by claims Nos...

Remark on Protest

- The additional search fees were accompanied by the applicant's protest.
- No protest accompanied the payment of additional search fees.
