Field of the Invention

[0002] This invention relates to methods of using certain inhibitors of MEK in combination with certain inhibitors of JAK-2 for the treatment of diseases in mammals, especially humans.

State of the Art

[0003] Improvements in the specificity of agents used to treat cancer is of considerable interest because of the therapeutic benefits which would be realized if the side effects associated with the administration of these agents could be reduced. Traditionally, dramatic improvements in the treatment of cancer are associated with identification of therapeutic agents acting through novel mechanisms.

[0004] Protein kinases are enzymes that catalyze the phosphorylation of proteins, in particular, hydroxy groups on tyrosine, serine and threonine residues of proteins. The consequences of this seemingly simple activity are staggering; cell differentiation and proliferation; i.e., virtually all aspects of cell life in one-way or another depend on protein kinase activity. Furthermore, abnormal protein kinase activity has been related to a host of disorders, ranging from relatively non-life threatening diseases such as psoriasis to extremely virulent diseases such as glioblastoma (brain cancer).

[0005] Tyrosine kinases can be categorized as receptor type or non-receptor type. Receptor-type tyrosine kinases have an extracellular, a transmembrane, and an intracellular portion, while non-receptor type tyrosine kinases are wholly intracellular. They are comprised of a large number of transmembrane receptors with diverse biological activity. In fact, about 20 different subfamilies of receptor-type tyrosine kinases have been identified. One tyrosine kinase subfamily, designated the HER subfamily, is
comprised of EGFR (HER1), HER2, HER3, and HER4. Ligands of this subfamily of receptors identified so far include epithelial growth factor, TGF-alpha, amphiregulin, HB-EGF, betacellulin and heregulin. Another subfamily of these receptor-type tyrosine kinases is the insulin subfamily, which includes INS-R, IGF-IR, and IR-R. The PDGF subfamily includes the PDGF-alpha and beta receptors, CSFIR, c-kit and FLK-II. In addition, there is the FLK family, which is comprised of the kinase insert domain receptor (KDR), fetal liver kinase-1 (FLK-1), fetal liver kinase-4 (FLK-4) and the fms-like tyrosine kinase-1 (flt-1).

The non-receptor type of tyrosine kinases is also comprised of numerous subfamilies, including Src, Frk, Btk, Csk, Abl, Zap70, Fes/Fps, Fak, Jak, Ack, and LIMK. Each of these subfamilies is further sub-divided into varying receptors. For example, the Src subfamily is one of the largest and includes Src, Yes, Fyn, Lyn, Lck, Blk, Hck, Fgr, and Yrk. The Src subfamily of enzymes has been linked to oncogenesis. For a more detailed discussion of the non-receptor type of tyrosine kinases, see Bolen, *Oncogene*, 8:2025-2031 (1993), which is hereby incorporated by reference.

Since protein kinases and their ligands play critical roles in various cellular activities, deregulation of protein kinase enzymatic activity can lead to altered cellular properties, such as uncontrolled cell growth associated with cancer. In addition to oncological indications, altered kinase signaling is implicated in numerous other pathological diseases. These include, but are not limited to: immunological disorders, cardiovascular diseases, inflammatory diseases, and degenerative diseases. Therefore, both receptor and non-receptor protein kinases are attractive targets for small molecule drug discovery.

One particularly attractive goal for therapeutic use of kinase modulation relates to oncological indications. For example, modulation of protein kinase activity for the treatment of cancer has been demonstrated successfully with the FDA approval of Gleevec® (imatinib mesylate, produced by Novartis Pharmaceutical Corporation of East Hanover, NJ) for the treatment of Chronic Myeloid Leukemia (CML) and gastrointestinal stroma capers. Gleevec is a selective Abl kinase inhibitor.

Modulation (particularly inhibition) of cell proliferation and angiogenesis, two cellular processes needed for tumor growth and survival, is an attractive goal for development of small-molecule drugs. Anti-angiogenic therapy represents a potentially important approach for the treatment of solid tumors and other diseases associated with
dysregulated vascularization, including ischemic coronary artery disease, diabetic retinopathy, psoriasis and rheumatoid arthritis. Cell antiproliferative agents are also desirable to slow or stop the growth of tumors.

Another target for small-molecule modulation, with respect to antiangiogenic and antiproliferative activity is MEK. Inhibition of MEK1 (MAPK/ERK Kinase) is a promising strategy to control the growth of tumors that are dependent on aberrant ERK/MAPK pathway signaling. The MEK-ERK signal transduction cascade is a conserved pathway which regulates cell growth, proliferation, differentiation, and apoptosis in response to growth factors, cytokines, and hormones. This pathway operates downstream of Ras which is often upregulated or mutated in human tumors. It has been demonstrated that MEK is an effector of Ras function. The ERK/MAPK pathway is upregulated in 30% of all tumors and oncogenic activating mutations in K-Ras and B-Raf have been identified in 22% and 18% of all cancers respectively (Allen et al., 2003; Bamford S, 2004; Davies et al., 2002; Malumbres and Barbacid, 2003). A large portion of human cancers, including 66% (B-Raf) of malignant melanomas, 60% (K-Ras) and 4% (B-Raf) of pancreatic cancers, 50% of colorectal cancers (colon, in particular, K-Ras: 30%, B-Raf: 15%), 20% (K-Ras) of lung cancers, 27% (B-Raf) papillary and anaplastic thyroid cancer, and 10-20% (B-Raf) of endometriod ovarian cancers, harbor activating Ras and Raf mutations. It has been shown that inhibition of the ERK pathway, and in particular inhibition of MEK kinase activity, results in anti-metastatic and anti-angiogenic effects largely due to a reduction of cell-cell contact and motility as well as downregulation of vascular endothelial growth factor (VEGF) expression. Furthermore, expression of dominant negative MEK, or ERK reduced the transforming ability of mutant Ras as seen in cell culture and in primary and metastatic growth of human tumor xenografts in vivo. Therefore, the MEK-ERK signal transduction pathway is an appropriate pathway to target for therapeutic intervention.

Binding of growth factors and cytokines to their cell surface receptors results in activation of intracellular signaling pathways which control cell proliferation, survival and differentiation. Key components of these pathways are protein kinases, which phosphorylate tyrosine, serine or threonine residues and thereby modulate the activity of substrate proteins. Two major signaling pathways which emanate from growth factor and cytokine receptors are the Ras/raf/MEK/Erk and the JAK/STAT pathways. Activation of the small GTPase Ras, leads to activation of a cascade of serine / threonine kinases which
initiates with Raf and, via activation of MEK, results in stimulation of ERK activity and phosphorylation of numerous substrates that control cellular proliferation and differentiation. Activation of members of the JAK family of cytoplasmic tyrosine kinases results in phosphorylation of members of the STAT family of inducible transcription factors. Phosphorylation of a key regulatory tyrosine residue in STAT proteins by JAKs results in their dimerization, translocation to the nucleus and binding to specific DNA sequences in the promoters and enhancers of regulated genes. The DNA-bound STATs serve to promote the transcription of these genes, many of which are involved in the control of cellular growth.

[0012] The Ras/Raf/MEK/ERK and JAK/STAT pathways intersect at the levels of the STAT proteins. The STATs are substrates for ERK kinases and are phosphorylated by ERKs in their C-terminal transcriptional activation domain. Phosphorylation at this site is required for efficient transcriptional activation by STAT proteins.

[0013] Constitutive STAT activation is a feature of a wide variety of human tumors. In particular, activation of STAT5 is observed in leukemias, including CML, AML and ALL, whereas activation of STAT3 is a common feature of solid tumors including prostate carcinoma, non-small cell lung carcinoma and head and neck tumors. Reduction of STAT3 or STAT5 levels results in a reduction in tumor cell growth and in some cases induction of tumor cell apoptosis in preclinical models. It is therefore desirable to develop strategies for pharmacologically inhibiting STAT activity in tumor cells as a method for treating cancers.

**SUMMARY OF THE INVENTION**

[0014] In one aspect, the methods of the invention involve simultaneous inhibition of both tyrosine and serine phosphorylation of STATs which is intended to maximally inhibit STAT activity thereby providing maximal opportunity to achieve therapeutic benefit in patients whose tumors have activated STATs.

The symbol "-" means a single bond, "=" means a double bond, "≡" means a triple bond, and "\(_t\)" means a single bond and optionally a double bond. When chemical structures are depicted or described, unless explicitly stated otherwise, all carbons are assumed to have hydrogen substitution to conform to a valence of four.

"Spiro", "Spirocycll" or "spiro ring" refers to a ring originating from a particular annular carbon of another ring. For example, as depicted below, a ring atom of a saturated bridged ring system (rings B and B'), but not a bridgehead atom, can be a shared atom between the saturated bridged ring system and a spirocyclyl (ring A) attached thereto.
[0029] "Yield" for each of the reactions described herein is expressed as a percentage of the theoretical yield.

[0030] "Patient" for the purposes of the present invention includes humans and other animals, particularly mammals, and other organisms. Thus the methods are applicable to both human therapy and veterinary applications. In a specific embodiment the patient is a mammal, and in a more specific embodiment the patient is human.

[0031] "Kinase-dependent diseases or conditions" refer to pathologic conditions that depend on the activity of one or more protein kinases. Kinases either directly or indirectly participate in the signal transduction pathways of a variety of cellular activities including proliferation, adhesion, migration, differentiation and invasion. Diseases associated with kinase activities include tumor growth, the pathologic neovascularization that supports solid tumor growth, and associated with other diseases wherein excessive local vascularization is involved such as ocular diseases (diabetic retinopathy, age-related macular degeneration, and the like) and inflammation (psoriasis, rheumatoid arthritis, and the like).

[0032] While not wishing to be bound to theory, phosphatases can also play a role in "kinase-dependent diseases or conditions" as cognates of kinases; that is, kinases phosphorylate and phosphatases dephosphorylate, for example protein substrates. Therefore compounds of the invention, while modulating kinase activity as described herein, may also modulate, either directly or indirectly, phosphatase activity. This additional modulation, if present, may be synergistic (or not) to activity of compounds of the invention toward a related or otherwise interdependent kinase or kinase family. In any case, as stated previously, the compounds of the invention are useful for treating diseases characterized in part by abnormal levels of cell proliferation (i.e. tumor growth), programmed cell death (apoptosis), cell migration and invasion and angiogenesis associated with tumor growth.

[0033] "Therapeutically effective amount" is an amount of a compound of the invention, that when administered to a patient, ameliorates a symptom of the disease. The amount of a compound of the invention which constitutes a "therapeutically effective
amount” will vary depending on the compound, the disease state and its severity, the age of the patient to be treated, and the like. The therapeutically effective amount can be determined routinely by one of ordinary skill in the art having regard to their knowledge and to this disclosure.

[0034] “Cancer” refers to cellular-proliferative disease states, including but not limited to: **Cardiac**: sarcoma (angiosarcoma, fibrosarcoma, rhabdomyosarcoma, liposarcoma), myxoma, rhabdomyoma, fibroma, lipoma and teratoma; **Lung**: bronchogenic carcinoma (squamous cell, undifferentiated small cell, undifferentiated large cell, adenocarcinoma), alveolar (bronchiolar) carcinoma, bronchial adenoma, sarcoma, lymphoma, chondromatous hantartoma, inesothelioma; **Gastrointestinal**: esophagus (squamous cell carcinoma, adenocarcinoma, leiomyosarcoma, lymphoma), stomach (carcinoma, lymphoma, leiomyosarcoma), pancreas (ductal adenocarcinoma, insulinoma, glucagonoma, gastrinoma, carcinoid tumors, vipoma), small bowel (adenocarcinoma, lymphoma, carcinoid tumors, Karposi's sarcoma, leiomyoma, hemangioma, lipoma, neurofibroma, fibroma), large bowel (adenocarcinoma, tubular adenoma, villous adenoma, hamartoma, leiomyoma); **Genitourinary tract**: kidney (adenocarcinoma, Wilm's tumor [nephroblastoma], lymphoma, leukemia), bladder and urethra (squamous cell carcinoma, transitional cell carcinoma, adenocarcinoma), prostate (adenocarcinoma, sarcoma), testis (seminoma, teratoma, embryonal carcinoma, teratocarcinoma, choriocarcinoma, sarcoma, interstitial cell carcinoma, fibroma, fibroadenoma, adenomatoid tumors, lipoma); **Liver**: hepatoma (hepatocellular carcinoma), cholangiocarcinoma, hepatoblastoma, angiosarcoma, hepatocellular adenoma, hemangioma; **Bone**: osteogenic sarcoma (osteosarcoma), fibrosarcoma, malignant fibrous histiocytoma, chondrosarcoma, Ewing's sarcoma, malignant lymphoma (reticulum cell sarcoma), multiple myeloma, malignant giant cell tumor chordoma, osteochronfroma (osteoartilaginous exostoses), benign chondroma, chondroblastoma, chondromyxofibroma, osteoid osteoma and giant cell tumors; **Nervous system**: skull (osteoma, hemangioma, granuloma, xanthoma, osteitis deformans), meninges (meningioma, meningio sarcoma, gliomatosis), brain (astrocytoma, medulloblastoma, glioma, ependymoma, germinoma [pinealoma], glioblastoma multiform, oligodendrolioma, schwannoma, retinoblastoma, congenital tumors), spinal cord neurofibroma, meningioma, glioma, sarcoma); **Gynecological**: uterus (endometrial carcinoma), cervix (cervical carcinoma, pre-tumor cervical dysplasia), ovaries (ovarian
carcinoma [serous cystadenocarcinoma, mucinous cystadenocarcinoma, unclassified carcinoma], granulosa-thecal cell tumors, Sertoli-Leydig cell tumors, dysgerminoma, malignant teratoma), vulva (squamous cell carcinoma, intraepithelial carcinoma, adenocarcinoma, fibrosarcoma, melanoma), vagina (clear cell carcinoma, squamous cell carcinoma, botryoid sarcoma (embryonal rhabdomyosarcoma), fallopian tubes (carcinoma); **Hematologic:** blood (myeloid leukemia [acute and chronic], acute lymphoblastic leukemia, chronic lymphocytic leukemia, myeloproliferative diseases, multiple myeloma, myelodysplastic syndrome), Hodgkin's disease, non-Hodgkin's lymphoma [malignant lymphoma]; **Skin:** malignant melanoma, basal cell carcinoma, squamous cell carcinoma, Karposi's sarcoma, moles dysplastic nevi, lipoma, angioma, dermatofibroma, keloids, psoriasis; and **Adrenal Glands:** neuroblastoma. Thus, the term "cancerous cell" as provided herein, includes a cell afflicted by any one of the above-identified conditions.

MEK Definitions

[00131] The following definitions apply to the MEK compounds described above only. These definitions are not to be considered when determining the scope and meaning of the JAK-2 compounds. To the same extent, the JAK-2 definitions are not to be considered when determining the scope and meaning of the MEK compounds.

[00132] When chemical structures are depicted or described, unless explicitly stated otherwise, all carbons are assumed to have hydrogen substitution to conform to a valence of four. For example, in the structure on the left-hand side of the schematic below there are nine hydrogens implied. The nine hydrogens are depicted in the right-hand structure. Sometimes a particular atom in a structure is described in textual formula as having a hydrogen or hydrogens as substitution (expressly defined hydrogen), for example, -CH$_2$CH$_2$-. It is understood by one of ordinary skill in the art that the aforementioned descriptive techniques are common in the chemical arts to provide brevity and simplicity to description of otherwise complex structures.

![Chemical Structure](image)

[00133] If a group "R" is depicted as "floating" on a ring system, as for example in the formula:

![Floating Group](image)
then, unless otherwise defined, a substituent "R" may reside on any atom of the ring system, assuming replacement of a depicted, implied, or expressly defined hydrogen from one of the ring atoms, so long as a stable structure is formed.

[00134] If a group "R" is depicted as floating on a fused ring system, as for example in the formulae:

\[
\begin{align*}
(R)_y & \quad \text{or} \quad (R)_y \\
\end{align*}
\]

then, unless otherwise defined, a substituent "R" may reside on any atom of the fused ring system, assuming replacement of a depicted hydrogen (for example the -NH- in the formula above), implied hydrogen (for example as in the formula above, wherein the hydrogens are not shown but understood to be present), or expressly defined hydrogen (for example where in the formula above, "X" equals =CH-) from one of the ring atoms, so long as a stable structure is formed. In the example depicted, the "R" group may reside on either the 5-membered or the 6-membered ring of the fused ring system. In the formula depicted above, when y is 2 for example, then the two "R's" may reside on any two atoms of the ring system, again assuming each replaces a depicted, implied, or expressly defined hydrogen on the ring.

[00135] When a group "R" is depicted as existing on a ring system containing saturated carbons, as for example in the formula:

\[
(R)_y
\]

JAK-2 Definitions

The following definitions apply to the JAK-2 compounds described above only. These definitions are not to be considered when determining the scope and meaning of the MEK compounds. To the same extent, the MEK definitions are not to be considered when determining the scope and meaning of the JAK-2 compounds.

"Alkyl" is intended to include Ci-C20, more typically, Ci-C12 linear or branched structures and combinations thereof, inclusively. "Lower alkyl" is intended to include Q - C6 linear or branched structures and combinations thereof, inclusively. For example, "C6 alkyl" can refer to an n-hexyl, wo-hexyl, cyclobutylethyl, and the like. Examples of lower alkyl groups include methyl, ethyl, propyl, isopropyl, butyl, s-butyl, t-butyl, isobutyl, pentyl, hexyl and the like. Higher alkyl refers to alkyl groups containing more than six carbon atoms.

"Cycloalkyl" means a non-aromatic mono- or multicyclic ring system comprising about 3 to about 14 carbon atoms, 5 to 10 carbon atoms, or 5 to about 7 ring atoms. Non-limiting examples of monocyclic cycloalkyls include cyclopropyl, cyclopentyl, cyclohexyl, cycloheptyl and the like. Non-limiting examples of multicyclic cycloalkyls include 1-decalin, norbornyl, adamantyl and the like. Cycloalkyls can be fused or bridge ring systems or spirocyclic systems.

"Alkyl substituted with halo and hydroxy" means an alkyl group substituted with 1, 2, or 3 hydroxy and 1, 2, 3, 4, or 5 halo.

"Alkylene" refers to straight or branched chain divalent group consisting solely of carbon and hydrogen atoms, containing no unsaturation and having from one to ten carbon atoms, for example, methylene, ethylene, propylene, n-butylene and the like. Alkylene is a subset of alkyl, referring to the same residues as alkyl, but having two points of attachment and, specifically, fully saturated. Examples of alkylene include ethylene (-CH2CH2-), propylene (-CH2CH2CH2-), dimethylpropylene (-CH2C(CH3)2CH2-), and cyclohexylpropylene (-CH2CH2CH(C6H11)).

"Alkoxy" or "alkoxyl" refers to the group -O-alkyl, wherein the term "alkyl" is as defined hereinabove. Examples include methoxy, ethoxy, propoxy, isopropoxy, and the like. Lower alkoxy refers to groups containing one to six carbons.
"Substituted alkoxy" refers to the group -O-(substituted alkyl), the substitution on the alkyl group generally containing more than only carbon (as defined by alkoxy). Another exemplary substituted alkoxy group is hydroxyalkoxy or -O-alkyl-OH.
"Alkoxy" or "alkoxyl" refers to the group -O-alkyl, wherein the term "alkyl" is as defined hereinabove. Examples include methoxy, ethoxy, propoxy, isopropoxy, and the like. Lower alkoxy refers to groups containing one to six carbons.

"Substituted alkoxy" refers to the group -O-(substituted alkyl), the substitution on the alkyl group generally containing more than only carbon (as defined by alkoxy). Another exemplary substituted alkoxy group is hydroxyalkoxy or -O-alkyl-OH.

"Aryl" means a monovalent six - to fourteen-membered mono- or multicyclic ring, wherein the monocyclic ring is aromatic and at least one of the rings in the multicyclic ring is aromatic. An aryl can also be six- to ten membered, or six membered. Representative non-limiting examples of aryl include phenyl, naphthyl, and the like.

"Arylalkyl" means a residue in which an aryl moiety, as defined above, is attached to a parent structure via one of an alkylene, alkylidene, or alkylidyne group. Examples include benzyl, phenethyl, phenylvinyl, phenylallyl and the like. The "alkyl" portion of the group can be one to ten carbons, and in another embodiment, one to six carbons; the latter can also be referred to as C6 aryllkyl. When a group is referred to as or "-(Cr 0)alkylaryl," an aryl moiety is attached to a parent structure via an alkylene group. Examples include benzyl, phenethyl, and the like.

In some examples, as appreciated by one of ordinary skill in the art, two adjacent groups on an aromatic system can be fused together to form a ring structure. The fused ring structure can contain heteroatoms and can be optionally substituted with one or more groups. It should additionally be noted that saturated carbons of such fused groups (i.e. saturated ring structures) can contain two substitution groups.

"Fused-polycyclic" or "fused ring system" refers to a polycyclic ring system that contains bridged or fused rings; that is, where two rings have more than one shared atom in their ring structures. In this application, fused-polycyclics and fused ring systems includes non-aromatic and aromatic systems. Typically, but not necessarily, fused-polycyclics share a vicinal set of atoms, for example naphthalene or 1,2,3,4-tetrahydro-naphthalene. A spiro ring system is not a fused-polycyclic by this definition, but fused polycyclic ring systems of the invention can themselves have spiro rings attached thereto via a single ring atom of the fused-polycyclic.

"Optionally substituted" refers to all subsequent modifiers in a term. So, for example, in the term "optionally substituted arylalkyl," both the "alkyl" portion and the "aryl" portion of the molecule is or is not substituted. A list of exemplary optional substitutions is presented below in the definition of "substituted."

But, the substituents of the substituents can not be substituted.

Some of the compounds of the invention can have imino, amino, oxo or hydroxy substituents off aromatic heterocyclyl systems. For purposes of this disclosure, it is understood that such imino, amino, oxo or hydroxy substituents can exist in their corresponding tautomeric form, i.e., amino, imino, hydroxy or oxo, respectively.

GENERAL SYNTHESIS OF MEK COMPOUNDS

The "MEK compounds: described herein can be made by the synthetic procedures described below. The starting materials and reagents used in preparing these compounds are either available from commercial suppliers such as Aldrich Chemical Co. (Milwaukee, Wis.), or Bachem (Torrance, Calif), or are prepared by methods known to those skilled in the art following procedures set forth in references such as Fieser and Fieser's Reagents for Organic Synthesis, Volumes 1-17 (John Wiley and Sons, 1991); Rodd's Chemistry of Carbon Compounds, Volumes 1-5 and Supplemental (Elsevier Science Publishers, 1989); Organic Reactions, Volumes 1-40 (John Wiley and Sons, 1991), March's Advanced Organic Chemistry, (John Wiley and Sons, 4th Edition) and Larock's Comprehensive Organic Chemistry.
Transformations (VCH Publishers Inc., 1989). These schemes are merely illustrative of some methods by which the MEK compounds can be synthesized, and various modifications to these schemes can be made and will be suggested to one skilled in the art having referred to this disclosure. The starting materials and the intermediates of the reaction may be isolated and purified if desired using conventional techniques, including but not limited to filtration, distillation, crystallization, chromatography and the like. Such materials may be characterized using conventional means, including physical constants and spectral data.

[0268] Unless specified to the contrary, the reactions described herein take place at atmospheric pressure and over a temperature range from about -78 °C to about 150 °C, more preferably from about 0 °C to about 125 °C and most preferably at about room (or ambient) temperature, e.g., about 20 °C. Unless otherwise stated (as in the case of an hydrogenation), all reactions are performed under an atmosphere of nitrogen.

[0269] Prodrugs can be prepared by techniques known to one skilled in the art. These techniques generally modify appropriate functional groups in a given compound. These modified functional groups regenerate original functional groups by routine manipulation or \textit{in vivo}. Amides and esters of the compounds described herein may be prepared according to conventional methods. A thorough discussion of prodrugs is provided in T. Higuchi and V. Stella, "Pro-drugs as Novel Delivery Systems," Vol 14 of the A.C.S. Symposium Series, and in Bioreversible Carriers in Drug Design, ed. Edward B. Roche, American Pharmaceutical Association and Pergamon Press, 1987, both of which are incorporated herein by reference for all purposes.

[0270] The MEK compounds, or their pharmaceutically acceptable salts, may have asymmetric carbon atoms or quaternized nitrogen atoms in their structure. Compounds of Formula I(N) or Formula I(M) that may be prepared through the syntheses described herein may exist as single stereoisomers, racemates, and as mixtures of enantiomers and diastereomers. The compounds may also exist as geometric isomers. All such single stereoisomers, racemates and mixtures thereof, and geometric isomers are intended to be within the scope of this invention. Some of the compounds described herein may exist as tautomers. For example, wherein a ketone or aldehyde is present, the molecule may exist in the enol form; wherein an amide is present, the molecule may exist as the imidic acid; and wherein an enamine is present, the molecule may exist as an imine. All such tautomers are within the scope of the invention.
The MEK compounds also includes N-oxide derivatives and protected derivatives of compounds of Formula I(N) or Formula I(M). For example, when compounds of Formula I(M) or I(N) contain an oxidizable nitrogen atom, the nitrogen atom can be converted to an N-oxide by methods well known in the art. When compounds of Formula I(M) or I(M) contain groups such as hydroxy, carboxy, thiol or any group containing a nitrogen atom(s), these groups can be protected with a suitable "protecting group" or "protective group". A comprehensive list of suitable protective groups can be found in T.W. Greene, Protective Groups in Organic Synthesis, John Wiley & Sons, Inc. 1991, the disclosure of which is incorporated herein by reference in its entirety. The protected derivatives of compounds of Formula I can be prepared by methods well known in the art.

Methods for the preparation and/or separation and isolation of single stereoisomers from racemic mixtures or non-racemic mixtures of stereoisomers are well known in the art. For example, optically active (R)- and (S)- isomers may be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques. Enantiomers (R- and S-isomers) may be resolved by methods known to one of ordinary skill in the art, for example by: formation of diastereoisomeric salts or complexes which may be separated, for example, by crystallization; via formation of diastereoisomeric derivatives which may be separated, for example, by crystallization, selective reaction of one enantiomer with an enantiomer-specific reagent, for example enzymatic oxidation or reduction, followed by separation of the modified and unmodified enantiomers; or gas-liquid or liquid chromatography in a chiral environment, for example on a chiral support, such as silica with a bound chiral ligand or in the presence of a chiral solvent. It will be appreciated that where a desired enantiomer is converted into another chemical entity by one of the separation procedures described above, a further step may be required to liberate the desired enantiomeric form. Alternatively, specific enantiomer may be synthesized by asymmetric synthesis using optically active reagents, substrates, catalysts or solvents or by converting on enantiomer to the other by asymmetric transformation. For a mixture of enantiomers, enriched in a particular enantiomer, the major component enantiomer may be further enriched (with concomitant loss in yield) by recrystallization.

In addition, the MEK compounds can exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like. In general, the solvated forms are considered equivalent to the unsolvated forms for the purposes of the present invention.
The chemistry for the preparation of the MEK compounds described herein is known to those skilled in the art.

The synthesis of azetidines substituted at the 3-position can be conveniently carried out according to Scheme 1:

Scheme 1

starting from the iV-diphenylmethyl protected azetidin-3-ol (1), readily prepared by reaction of epichlorohydrin and diphenylmethylamine (Chatterjee, Shym S.; Triggle, D. J. Chemical Communications (London) 1968, 2, 93). Protecting group exchange, from Boc to CBz, on
the azetidine is carried out according to literature protocols (Greene, T.W., Wuts, P.G. Protective Groups in Organic Synthesis, Wiley-Interscience) and subsequent oxidation to the azetidinone (2) wherein P is CBz provides a useful intermediate for the preparation of the MEK compounds described herein.

[0294] For example, the ketone intermediates of formula 2 can be broadly functionalized at the 3-position according to Scheme 2.

[0295] An intermediate of formula (3), wherein \( R^4 \) is as defined in the compound of Formula I(M) or Formula I(N) for a compound of Group A, Group B, Group C, or Group D can be prepared by reacting the intermediate 2 with Grignard reagents or other organometallic species of formula 17, such as organolithiums. Alternatively, the intermediate 2 can be reacted with nitroalkane anions of formula 18 prepared \textit{in-situ} as in the Henry reaction (The Henry reaction, recent examples: Luzzio, F. A. Tetrahedron 2001, 57(6), 915-945) to give (4) wherein \( R^{4'} \) is hydrogen or alkyl optionally substituted as described for \( R^4 \) in the compound of Formula I(M) or Formula I(N) for a compound of Group A, Group B, Group C, or Group D. Alternatively, the intermediate 2 can be reacted with ketone or aldehyde anions of formula 19 in a Claisen-type condensation to give (5) wherein \( R^{4''} \) is alkyl optionally substituted as described for \( R^4 \) in the compound of Formula I(M) or Formula I(N) for a compound of Group A, Group B, Group C, or Group D.
hydrogen or $R^4$. In addition, 2 can be reacted with Wittig reagents of formula 20 (wherein $R'$ and $R''$ are independently hydrogen, alkyl, alkenyl, aryl, or heteroaryl and the alkyl, alkenyl, aryl, and heteroaryl are optionally substituted as described for $R^4$ in the compound of Formula I(M) or Formula 1(N) for a compound of Group A, Group B, Group C, or Group D) to prepare intermediates of formula 6, which are also useful as precursors for MEK compounds described.

[0296] According to Scheme 3, intermediates of formula (6) wherein wherein ($R'$ and $R''$ are hydrogen and $P$ is a nitrogen-protecting group such as CBz or Boc)

**Scheme 3**

![Scheme 3 Diagram]

can be further converted to the corresponding epoxide (7) and subsequent reaction with a suitable nitrogen base or other nucleophiles may be carried out to give access to a broad range of azetidin-3-ol derivatives such as (8), wherein $R^8$ and $R^8'$ are as defined in the compound of Formula I(M) or Formula 1(N).

[0297] In some cases the preparation of optically pure compounds is desired wherein the azetidine contains one or more stereocenters. Numerous techniques for the preparation of optically pure compounds through both resolution techniques and asymmetric synthesis are well known in the art. In one such case, an asymmetric synthesis methodology can be employed wherein an azetidine precursor of formula (2) is reacted with an intermediate of formula 21 wherein $R'$ is not hydrogen, as depicted in Scheme 4.
One such useful approach makes use of Evans oxazolidinone methodology (Diastereoselective aldol condensation using a chiral oxazolidinone auxiliary. Gage, James R.; Evans, David A. Organic Syntheses 1990, 68, 83-91). The condensation of an azetidinone (2) with the a chiral oxazolidinone in the presence of a base such as LDA affords an intermediate oxazolidinone (9), wherein P is a nitrogen-protecting group such as CBz or Boc, with diastereoselectivity. Treatment with lithium hydroxide in aqueous hydrogen peroxide gives carboxylic acid (10) which can be subject to Curtius rearrangement to provide the chiral oxazolidinone (11) then carried forward as required to a useful intermediate (12).

Further protecting group manipulation and derivatization as required can be employed to prepare compounds of Formula I(M) or 1(N).

Alternatively, a racemic mixture of an intermediate of formula (13), useful to prepare a compound of Formula I(M) or 1(N) wherein $R^3$ is hydroxy and $R^4$ is heterocycloalkyl (in particular, wherein $R^4$ is a N-protected piperidine), can be prepared according to Scheme 5.

**Scheme 5**
In the reaction schemes $P_1$ and $P_2$ are orthogonal nitrogen-protecting groups. For example, $P_1$ is Boc and $P_2$ is CBz or $P_1$ is CBz and $P_2$ is Boc. The reaction is carried out *in-situ* by treating 22 to generate the lithated amine and by subsequently treating it with a ketone such as (2) according to the method of Peter Beak (Beak, Peter; Lee, Won Koo $\alpha$-Lithioamine synthetic equivalents: syntheses of diastereoisomers from the Boc-piperidines. Journal of Organic Chemistry 1990, 55(9), 2578-80). The racemate (13) thus prepared can be resolved by functionalization, as depicted in Scheme 6, with a chiral acid such as the readily-available Mosher acid (14).

Scheme 6

The resulting diastereomeric esters (15) can be separated by chromatographic means and then carried forward individually as the enantiomerically pure intermediates (R)-(16) and (S)-(16).

Scheme 7
The reaction is carried out in a solvent such as DMF, THF, or DCM in the presence of a base such as DIPEA, 1V-methylmorpholine, DMAP, or triethylamine and optionally in the presence of a coupling agent such as PyBOP, HBTU, or EDCI. Alternatively, an intermediate of Formula II, III(a), III(b), IV(a), IV(b), V(a), YQo), VI(a), YlQo), VII(a), YlQo), VIII(a), VIII(b), IX, X(a), XQo), XI(a), XIQo), XII, XIII, XIV, XVI, XVII, XVIII(a), XVIII(b), XIX, or XX can be converted into an acid halide according to Scheme 8

Scheme 8

\[ \pi-XX \rightarrow \text{Compound of Formula I(M) or 1(N)} \]

wherein \( X^2 \) is halo, such as chloro or fluoro, and all other groups are as defined in the compound of Formula I(M) or Formula 1(N) for a compound of Group A, Group B, Group C, or Group D. The reaction is carried out in a solvent such as dioxane, THF, or DCM in the presence of a base such as DIPEA, sodium bicarbonate. The acid halide of formula 18 can then be reacted with an azetidine intermediate of formula 17 to prepare a compound of Formula I(M) or 1(N).

The filtrate was partitioned with water and washed twice with water, brine, dried over sodium sulfate, filtered and concentrated in vacuo to give an orange oil which was purified by column chromatography. Eluting with 10% ethyl acetate in hexanes, isolated product was concentrated in vacuo to afford 9.80 g, 58 mmol (100%) of 1,1-dimethylethyl 3-methylideneazetidine-1-carboxylate as a colorless oil. \(^1\)H NMR (400 MHz, DMSO): 5.05-4.85 (m, 2H), 4.95-4.63 (m, 4H), 1.45 (s, 9H). GC-MS for C\(_9\)H\(_{15}\)NO\(_2\): 169.

To a solution of 1,1-dimethylethyl 3-methylideneazetidine-1-carboxylate (2.96 g, 17.5 mmol) in chloroform (180 mL) was added 3-chloroperoxybenzoic acid (77%, 13.9 g, 62.0 mmol), and the resulting mixture was stirred at room temperature for 2 days. The reaction mixture was quenched with a 1:1 mixture (150 mL) of 10% sodium thiosulfate and saturated sodium bicarbonate solutions. The organic portion was isolated, dried over sodium sulfate, filtered and concentrated to give an oily residue which was then purified by flash chromatography (15-50% ethyl acetate-hexanes) to give 1,1-dimethylethyl 1-oxa-5-azaspiro[2.3]hexane-5-carboxylate (1.65g, 51%), GC-MS for C\(_9\)H\(_{13}\)NO\(_3\): 185.

1,1-Dimethylethyl 1-oxa-5-azaspiro[2.3]hexane-5-carboxylate (51 mg, 0.28 mmol) was taken into THF (1 mL) followed by addition of morpholine (123 µL, 1.4 mmol) and the mixture was stirred for one hour at room temperature. The solution was then concentrated and the residue partitioned with ethyl acetate and water. The organic layer was washed once with water then brine and the organic layer dried over anhydrous sodium sulfate. Filtration and concentration gave a colorless oil that was purified by silica gel flash chromatography using ethyl acetate to 10% methanol in dichloromethane as eluents. The combined pure fractions were concentrated and the residue treated with neat TFA (1 mL) for 5 minutes then concentrated. The residue was taken into methanol (2 mL) and basified to pH > 10 by addition of Biorad AG-IX hydroxide form resin. Filtration and concentration afforded 3-(morpholin-4-ylmethyl)azetidin-3-ol (11.6 mg, 24% yield) as a colorless oil. \(^1\)H NMR (400
3-(Morpholin-4-ylmethyl)azetidin-3-ol (11.6 mg, 0.07 mmol) was taken into DMF (1 mL) followed by addition of DIPEA (35 µL, 0.21 mmol) and 3,4-difluoro-2-[(2-fluoro-4-iodophenyl)amino]benzoyl fluoride (28 mg, 0.07 mmol), prepared using procedures similar to those described in Reference 1, and the mixture was stirred for 30 minutes at room temperature. The solution was then concentrated in vacuo and the residue purified by preparative reverse phase HPLC. Lyophilization of the combined fractions gave l-({3,4-difluoro-2-[(2-fluoro-4-iodophenyl)amino]phenyl}carbonyl)-3-(morpholin-4-ylmethyl)azetidin-3-ol trifluoroacetate salt (6.3 mg) as a colorless amorphous solid.

1-((3,4-difluoro-2-[(2-fluoro-4-iodophenyl)amino]phenyl)carbonyl)-N-(2-hydroxyethyl)azetidine-3-carboxamide

[0496] To a solution of 1-((3,4-difluoro-2-[(2-fluoro-4-iodophenyl)amino]phenyl)carbonyl)azetidine-3-carboxylic acid (15 mg, 0.03 mmol), prepared using procedures similar to those in Example 1, in N,N-dimethylformamide (2.00 mL) was added HBTU (38 mg, 0.10 mmol). The mixture was stirred for 15 minutes at room temperature followed by the addition of 2-aminoethanol (3.6 µL, 0.06 mmol) and N-methylmorpholine (110 µL, 1.00 mmol). The mixture was allowed to stir at room
temperature for 3 d, then diluted the mixture with chloroform (20 mL), and washed with water (30 mL). The aqueous phase was back extracted with chloroform (10 mL). A solution of 3-(aminomethyl)-l-({3,4-difluoro-2-[(2-fluoro-4-iodophenyl)amino]phenyl}carbonyl)azetidin-3-ol (0.24 g, 0.5 mmol), prepared using procedures similar to those described in Example 3, and commercially available 1,1-bis(methylthio)-2-nitroethylene (0.083 g, 0.5 mmol) in ethanol (5 mL) was stirred at 70 °C for 16 hours. The reaction mixture was concentrated in vacuo. The residue was partitioned between ethyl acetate and water. The organic layer was washed with brine, dried over sodium sulfate, filtered and concentrated to afford 0.10 g, (39%) l-({3,4-difluoro-2-[(2-fluoro-4-iodophenyl)amino]phenyl}carbonyl)-3-({[(Z)-l-(methylthio)-2-nitroethenyl]amino}methyl)azetidin-3-ol. MS (EI) for C_{20}H_{18}F_{3}IN_{4}O_{4}S: 595 (MH^+).

To a solution of (0.05 g 0.08 mmol) l-({3,4-difluoro-2-[(2-fluoro-4-iodophenyl)amino]phenyl}carbonyl)-3-({[(Z)-l-(methylthio)-2-nitroethenyl]amino}methyl)azetidin-3-ol in ethanol (2 mL) was added ammonium hydroxide (0.1 mL, 0.8 mmol) and the reaction mixture was stirred at 70 °C for 16 hours. The reaction mixture was concentrated in vacuo. The crude product was purified by reverse phase preparative HPLC. The fractions were collected and the solvent was concentrated. The residue was partitioned with ethyl acetate. The organic layer was washed with saturated aqueous sodium bicarbonate, brine and dried over anhydrous sodium sulfate. Filtration and concentration resulted in an amorphous residue, which was dissolved in methanol, and 4 N HCl in dioxane (40 µL, 0.16 mmol) was added to the solution. A white precipitate formed and was collected by vacuum filtration. The solid was washed with hexane, and dried to afford 42 mg (87%) 3-({[(E)-l-amino-2-nitroethenyl]amino}methyl)-l-({3,4-difluoro-2-[(2-fluoro-4-iodophenyl)amino]phenyl}carbonyl)azetidin-3-ol hydrochloride. 1H NMR (400 MHz, d_{4}-MeOH): 7.58 (t, 0.5H), 7.44 (t, 0.5H), 7.36 (m, IH), 7.31 (m, IH), 7.04 (m, IH), 6.63 (m, IH), 3.90-4.30 (m, 4H) 3.72 (s, 2H); MS (EI) for C_{19}H_{17}F_{3}IN_{4}O_{4}: 564 (MH^+).

1-({3,4-difluoro-2-[(2-fluoro-4-iodophenyl)amino]phenyl}carbonyl)-3-(1^-imidazol-2-ylmethyl)azetidin-3-ol

[0649] A solution of 2-methyl-l-({[2-(trimethylsilyl)ethyl]oxy}methyl)-l H-imidazole (0.5 g, 2.3 mmol) (prepared using procedures similar to those described in Clader et. al. J. of Med. Chem. 1995, 38(10), 1600-7) in tetrahydrofuran (5 mL) was cooled to -78 °C, and n-butyllithium was added (2.5 M in hexanes, 0.990 mL, 2.5 mmol). After 2 hours, 1,1-dimethylethyl 3-oxoazetidine-l-carboxylate (0.60 g, 3.5 mmol), prepared using procedures similar to those described in Example 3, in 2.0 mL tetrahydrofuran was added and the solution was allowed to warm to room temperature and stirred overnight. The reaction mixture was quenched with an excess of saturated aqueous ammonium chloride solution and partitioned between water and ethyl acetate. The layers were separated and the aqueous layer was extracted with ethyl acetate (2 x 10 mL). The combined organic layers were dried over sodium sulfate, filtered and concentrated in vacuo. Column chromatography (silica gel, 3:1 hexanes/ethyl acetate) gave 0.37 g (41%) of 3-{{l-({[2-(trimethylsilyl)ethyl]oxy}methyl)-l H-imidazol-2-yl}methyl}azetidin-3-ol: 1H NMR (400 MHz, CDCl3): 6.96-6.92 (m, 1H), 5.23 (s, 2H), 3.98 (d, 2H), 3.79 (d, 2H), 3.52-3.47 (m, 2H), 3.13 (s, 2H), 1.43 (s, 9H), 0.94-0.88 (m, 2H), 0.00 (s, 9H).

[0650] 3-{{l-({2-(trimethylsilyl)ethyl]oxy}methyl)-l H-imidazol-2-yl}methyl}azetidin-3-ol (0.19 g, 0.49 mmol) was dissolved in dichloromethane (1.5 mL) and trifluroacetic acid (1.5 mL) was added. The reaction mixture was stirred at room temperature overnight and the solvent was removed under vacuum to give 0.16 g of 3-(l//-imidazol-2-ylmethyl)azetidin-3-ol trifluoroacetate salt (87%). The crude residue was used without further purification for the next step.

[0651] To a solution of 3-(l//-imidazol-2-ylmethyl)azetidin-3-ol trifluoroacetate salt (0.16 g, 0.42 mmol) and N,N-diisopropylethylamine (0.370 mL, 2.13 mmol) in tetrahydrofuran (2.0

The solution was partitioned between ethyl acetate and saturated aqueous sodium bicarbonate and the organic layer was dried over sodium sulfate and concentrated in vacuo. Purification by reverse-phase HPLC followed by lyophilization of the pure fractions gave 0.032 g (13%) of 1-[(3,4-difluoro-2-[(2-fluoro-4-iodophenyl)amino]phenyl] carbonyl)-3-[(1H-imidazol-2-ylmethyl)azetidin-3-ol acetate salt: $^1$H NMR (400 MHz, CD$_3$OD): 7.45 (dd, 1H), 7.38-7.33 (m, 1H), 7.25-7.18 (m, 1H), 7.08-6.96 (m, 1H), 6.89 (s, 2H), 6.65-6.56 (m, 1H), 4.33-4.22 (m, 1H), 4.17-4.00 (m, 2H), 3.91-3.80 (m, 1H), 3.08 (s, 2H), 1.96 (s, 3H). ![Chemical structure](image)

[0652] To a solution of diisopropylamine (6.5 mL, 46.3 mmol) in THF (200 mL) at -78 °C was added butyllithium (17 mL of a 2.5 M solution in hexanes, 42.5 mmol) over 5 min. The solution of lithium diisopropylamide was stirred for 15 min at -78 °C. A solution of (S)-4-benzyl-3-propionyl-2-oxazolidinone (9.0 g, 38.6 mmol) in THF (100 mL) was added to the lithium diisopropylamide by addition funnel over 26 min. The reaction temperature was kept below -70 °C during the course of the addition. After the addition, the mixture was stirred for a further 30 min at -78 °C. Then phenylmethyl 3-oxoazetidine-l-carboxylate (9.5 g, 46.3 mmol) was added by addition funnel over 25 minutes as a solution in THF (100 mL). Again, the reaction mixture was kept below -70 °C during the reagent addition. After stirring for an additional 1 hour at -78 °C, the reaction mixture was quenched with saturated ammonium chloride solution and was then allowed to warm to rt. Water was added to dissolve any precipitated ammonium chloride, and ethyl acetate was added. The layers were partitioned, and the aqueous phase was extracted twice with ethyl acetate. The combined organic

The residue was purified by column chromatography (50% ethyl acetate: 50% hexanes) to provide phenylmethyl 3-hydroxy-3-\{[(1\text{?})]-methyl-2-oxo-2-[(45)-2-oxo-4-(phenylmethyl)-1,3-oxazolidin-3-yl]ethyl\}azetidine-1-carboxylate as a white crystalline solid (6.03 g, 13.8 mmol, 36% yield). $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 7.37 (m, 8H), 7.20 (d, 2H), 5.12 (s, 2H), 4.66 (m, IH), 4.27-4.20 (m, 2H), 4.10 (q, IH), 4.03-3.93 (m, 3H), 3.28 (dd, IH), 2.77 (dd, IH), 1.29 (d, 3H).

[0653] A solution of lithium hydroxide monohydrate (1.16 g, 27.6 mmol) in 30% hydrogen peroxide (13.2 mL, 138 mmol) was prepared and was subsequently added slowly to a solution of phenylmethyl 3-hydroxy-3-\{[(17\text{?})]-methyl-2-oxo-2-[(45)-2-oxo-4-(phenylmethyl)-1,3-oxazolidin-3-yl]ethyl\}azetidine-1-carboxylate (6.03 g, 13.8 mmol) in THF (80 mL) and water (20 mL) at 0°C. After the mixture was stirred for 1 hour at rt, the hydrogen peroxide was quenched carefully with 1 M sodium sulfite (150 mL, 150 mmol). The THF was removed in vacuo, and the mixture was then acidified to pH=2 with concentrated hydrochloric acid. The aqueous mixture was extracted twice with ethyl acetate. The combined organic extracts were dried over magnesium sulfate, filtered, and concentrated in vacuo. The resulting residue was purified by column chromatography (gradient, 5% methanol: 95% dichloromethane to 10% methanol: 90% dichloromethane) to provide (2R)-2-(3-hydroxy-1-\{[(phenylmethyl)oxy]carbonyl\}azetidin-3-yl)propanoic acid (2.77 g, 9.9 mmol, 72% yield). $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 7.37-7.31 (m, 5H), 5.10 (s, 2H), 3.99 (s, 2H), 3.93 (s, 2H), 2.88 (q, IH), 1.28 (d, 3H); MS (EI) for C$_4$H$_7$NO$_3$: 280 (MH$^+$).

The mixture was heated to 80°C for 2 h and was then cooled to rt. The volatile materials were removed in vacuo, and the residue was purified by column chromatography (gradient: 50% hexanes: 50% ethyl acetate up to 100% ethyl acetate). The desired product, (8\text{?})-8-methyl-6-oxo-5-oxa-2,7-diazaspiro[3.4]octane-2-carboxylic acid phenylmethyl ester, was isolated as a viscous, colorless syrup (1.84 g, 6.6 mmol, 67% yield). $^1$H NMR (400 MHz, CDCl$_3$) $\delta$ 7.39-7.32 (m, 5H), 5.66 (br s, IH), 5.12 (s, 2H), 4.34 (dd, IH), 4.30 (dd, IH), 4.17 (dd, IH), 4.05 (dd, IH), 3.98 (q, IH), 1.34 (d, 3H).

The resulting suspension was stirred under 1 atm of hydrogen for 1 h. The catalyst was then removed by filtration through celite. The filtrate was concentrated in vacuo to provide (8i?)-8-methyl-5-oxa-2,7-diazaspiro[3.4]octan-6-one as a white solid (0.99 g, quantitative yield). 1H NMR (400 MHz, CDCl₃) δ 5.23 (br s, IH), 4.07 (d, IH), 4.02 (d, IH), 3.92 (d, IH), 3.79 (d, IH), 3.58 (d, IH), 1.38 (d, 3H); MS (EI) for C₆H₁₆N₂O₂: 143 (MH⁺).

A solution of (8R)-8-methyl-5-oxa-2,7-diazaspiro[3.4]octan-6-one (937 mg, 6.6 mmol), acetic acid (0.756 mL, 13.2 mmol), and benzaldehyde (1.0 mL, 9.9 mmol) in methanol (65 mL) was treated with sodium cyanoborohydride (829 mg, 13.2 mmol) at rt for 30 min. The mixture was then cooled to 0 °C, and 3 N hydrochloric acid (100 mL) was added. The methanol was then removed in vacuo. The resulting aqueous solution was washed with ethyl acetate. The ethyl acetate wash was back extracted with 1 N hydrochloric acid, and the aqueous acidic phases were combined and basified with potassium carbonate. The organic phase was discarded. The aqueous mixture was then extracted three times with ethyl acetate. The combined organic extracts were dried over magnesium sulfate, filtered, and concentrated in vacuo. The desired (8i?)-8-methyl-2-(phenylmethyl)-5-oxa-2,7-diazaspiro[3.4]octan-6-one was obtained in 93% purity as a milky colorless liquid (1.33 g, 5.73 mmol, 87% yield). After cooling to rt, the mixture was acidified with 3 N hydrochloric acid (10 mL) and dichloromethane (50 mL) was added. The biphasic mixture was treated with potassium carbonate (1.6 g, 11.4 mmol) and di-tert-butyl dicarbonate (2.11 g, 9.7 mmol). After stirring vigorously at rt for 17 h, solids were removed by filtration, and the layers were partitioned. The aqueous phase was extracted with dichloromethane, and the organic extracts were combined and dried over magnesium sulfate, filtered, and concentrated. The residue was taken up in methanol (60 mL) and was treated with potassium carbonate (3.0 g, 22 mmol) added in two portions over 4 h at reflux. To a solution of IV,N-diisopropylamine (1.6 mL, 11.2 mmol) cooled to -78 °C in THF (15 mL) was added a 2.5 M solution of n-BuLi in hexane (4.5 mL, 11.2 mmol)
dropwise over 5 minutes and the mixture was stirred at this temperature for an addition 15
minutes. 6-methyl-1-(phenylmethyl)piperidine-2-carbonitrile (2.4 g, 11.2 mmol) (prepared
using procedures similar to those in Bonin et. al. Tet. Lett. 1982, 23(33), 3369-72) in THF
(10 mL) was then added dropwise over 20 minutes and the reaction mixture was stirred for a
further 30 minutes. Next a solution of 1,1-dimethylethyl 3-oxoazetidine-1-carboxylate (1.3
g, 7.5 mmol), prepared using procedures similar to those in Example 3, in THF (10 mL) was
added dropwise over 30 minutes. The reaction mixture was gradually warmed to room
temperature and allowed to stir overnight. The reaction mixture was quenched with 10%
citric acid and extracted with ethyl acetate (3 x 50 mL). The combined organic layers were
washed with water, brine, dried over anhydrous sodium sulfate then filtered and concentrated
in vacuo to give crude product as yellow oil. Further purification by flash chromatography
(30% ethyl acetate in hexanes) afforded 1,1-dimethylethyl 3-[2-cyano-6-methyl-1-(phenylmethyl)piperidin-2-yl]-3-hydroxyazetidine-1-carboxylate as a pale yellow oil (0.2 g, 7%
yield). 1H NMR (400 MHz, CDCl₃): 7.17-7.40 (m, 5H), 4.42 (d, IH), 4.04-4.18 (m,
IH), 3.83-4.00 (m, IH), 3.70-3.75 (m, 2H), 1.70-1.87 (m, 4H), 1.45 (s, 3H), 1.41 (s, 9H),
1.22-1.26 (m, IH), 1.13-1.18 (m, 2H); MS (EI) for C₂₂H₃₁N₃O₅: 386 (MH⁺).

To a stirred solution of 1,1-dimethylethyl 3-[2-cyano-6-methyl-1-(phenylmethyl)piperidin-2-yl]-3-hydroxyazetidine-1-carboxylate (180 mg, 0.47 mmol) in ethanol (1 mL) was added acetic acid (53.5 µL, 0.94 mmol) followed by sodium
cyanoborohydride (58.7 mg, 0.94 mmol) and the reaction mixture stirred at 70 ℃ overnight.
After cooling to room temperature the suspension was filtered through celite and the solid
washed with additional ethanol. The filtrate was concentrated in vacuo and taken up in ethyl
acetate (30 mL). The organic layer was washed with 2 M sodium hydroxide solution. The
sodium hydroxide layer was separated and washed with ethyl acetate (10 mL). The
combined organic layers were washed with brine, dried over anhydrous magnesium sulfate
and concentrated in vacuo to give crude 1,1-dimethylethyl 3-hydroxy-3-[6-methyl-1-(phenylmethyl)piperidin-2-yl]azetidine-1-carboxylate as yellow oil (60 mg, 36% yield).
Crude product was used further without purification. 1H NMR (400 MHz, CDCl₃): 7.22-

hydrogen chloride (4N in dioxane, 0.5 mL) and the reaction mixture stirred at 60 °C for one hour. The reaction mixture was cooled to room temperature and concentrated in vacuo and azeotroped 3 times from methanol and diethyl ether. On drying the hydrochloride salt of 3-[6-methyl-1-(phenylmethyl)piperidin-2-yl]azetidin-3-ol was obtained as a dark brown residue (40 mg, 81% yield), which was used further without purification. 1H NMR

**Biochemical Assay**

[0714] For a biochemical measurement of MEKI inhibitory activity, MEK compounds were screened in a triple coupled cRaf-MEK-ERK2 assay using ALPHASCREEN (Registered Trademark of Perkin Elmer) technology (Perkin Elmer). The MEK compound 0.5 µL of 100% DMSO stock solution, is diluted into an assay buffer composed of 20 mM Tris (pH = 7.5), 10 mM magnesium chloride, 0.03% CHAPS and 1 mM DTT. Subsequently, 10 µL of substrate mixture is added composed of inactive MEKI (3 nM), ATP (50 µM), unactive ERK2 (4 nM), biotinylated MBP peptide (b-FFKNIVTPRTPPPSQGK, 1 µM) and antiphospho MBP peptide (0.5 nM). The mixture is then gently shaken for 30 minutes at room temperature followed by addition of active cRaf (5 µL at 0.5 nM) to initiate reaction. The mixture is then shaken for 100 minutes at room temperature then quenched by addition of 10 µL of a mixture of 5µg/mL streptavidin donor beads and 5µg/mL protein A acceptor beads in detection buffer (75 mM Hepes pH = 7.5, 300 mM sodium chloride, 120 mM EDTA, 0.3% BSA and 0.03% Tween), followed by incubation overnight and signal detection on an ALPHAQuest® (Registered Trademark of Perkin Elmer) plate reader (Perkin Elmer).

**Endogenous ERK Phosphorylation ELISA Assay**

[0716] MDA-MB-231T (ATCC), Calu-6 (ATCC), HCT 116 (ATCC), A2058 (ATCC), and A375 (ATCC) cells were seeded at 20000, 30000, 50000, 20000, and 30000 cells/well, respectively, onto black 96-well microtiter plates (Costar 3904), in DMEM (Cellgro) containing 10% FBS (Heat-Inactivated, Cellgro), 1% NEAA (Cellgro), and 1% Pen/Strep (Cellgro). SK-MEL-28 (ATCC) cells were seeded at 20000 cells/well in MEM (ATCC) containing 10% FBS (Heat-Inactivated, Cellgro), and 1% Pen/Strep (Cellgro). The cells were then incubated at 37°C, 5% CO₂ for 24 hours. Serum starvation was performed by replacing the medium with serum-free DMEM or MEM for an additional 24 hours. Serial dilutions of test compounds in fresh serum-free medium in a final concentration of 0.3% DMSO (vehicle) were added to the cells and incubated for 1 hour. Negative control wells were in serum-free medium + 0.3% DMSO only. After treatment, the medium was removed and cells were fixed with 4% formaldehyde, followed by quenching of endogenous peroxidases with 0.6% H₂O₂. Plates were then blocked (10% FBS, Cellgro) and incubated with mouse monoclonal anti-phospho-p44/42 MAPK, EiO (1:2000, Cell Signaling), followed by secondary antibody (HRP-conjugated, goat anti-mouse IgG, 1:3000 from Jackson ImmunoResearch Laboratories, Inc). Washing of the plates was performed with PBS-T (0.1% Triton X-100) in between all
incubation steps. A luminol-based substrate solution was then added and plates read using the Victor Wallac machine. IC<sub>50</sub> values were determined based on total ERK phosphorylation with compound treatment versus total ERK phosphorylation with 0.3% DMSO treatment alone.

[0717] MDA-MB-231T (ATCC), Calu-6 (ATCC), HCT 116 (ATCC), A2058 (ATCC), A375 (ATCC), and Colo-205 (ATCC) cells were plated at densities of 2500, 3500, 3500, 2500, 3500, and 15000 cells/well onto 96-well microtiter plates (Cat# 3904, Costar), in DMEM (Cellgro) containing 10% FBS (Heat Inactivated, Cellgro), 1% Pen/Strep (Cellgro), and 1% NEAA (Cellgro). SK MEL-28 (ATCC) and WM-266-4 (ATCC) were plated at densities of 2000 and 6000 cells/well in MEM (ATCC) containing 10% FBS (Heat-Inactivated, Cellgro), and 1% Pen/Strep (Cellgro). The cells were incubated overnight at 37°C, 5% CO<sub>2</sub> for 18 h. The next day, cells were treated with a serial dilution of compound in medium (containing a final concentration of 0.3% DMSO). Triplicate wells were used for each compound concentration. The control wells received 0.3% DMSO media. The cultures were incubated at 37°C, 5% CO<sub>2</sub> for an additional 48 hours. The cells were assayed for proliferation according to the "Cell Proliferation ELISA, Bromo Deoxyuridine (BrdU) (chemiluminescence) kit" from Roche. The cells were treated with the BrdU labeling solution and then fixed with FixDenat solution. Anti-BrdU-POD (PerOxiDase) conjugate was added to the cells, after which the plates were washed 3x with IX PBS. Substrate solution was added, and the plates were read for luminescence using the Victor Wallac machine. IC<sub>50</sub> values were calculated based on the cell proliferation with compound treatment compared to the vehicle control.

On day 0, cells were harvested by trypsinization, and 5x10⁶ cells (passage #8, 96% viability) in 0.1 mL ice-cold Hank's balanced salt solution were implanted intradermally in the hind-flank of 5-8 week old female athymic nude mice.

For subcutaneous or intradermal tumors, the mean tumor weight of each animal in the respective control and treatment groups was determined twice weekly during the study. Tumor weight (TW) was determined by measuring perpendicular diameters with a caliper,
using the following formula: tumor weight (mg) = \[\text{tumor volume} = \text{length (mm)} \times \text{width}^2 (\text{mm}^2)\]/2.

[0725] Percent inhibition of tumor growth (TGI) is determined with the following formula:

\[
1 - \left( \frac{X_f - X_0}{Y_f - X_0} \right) \times 100
\]

wherein \(X_0\) = average TW of all tumors on group day; \(X_f\) = TW of treated group on Day f; \(Y_f\) = TW of vehicle control group on Day f.

[0726] If tumors regress below their starting sizes, then the percent tumor regression is determined with the following formula:

\[
\left( \frac{X_0 - X_f}{X_0} \right) \times 100
\]

[0727] TGI is calculated individually for each tumor to obtain a mean ± SEM value for each experimental group. Statistical significance is determined using the 2-tailed Student's t-test (significance defined as \(P<0.05\)).

UTILITY OF JAK-2 COMPOUNDS

The compounds of Formula I(J) are useful for treating diseases, particularly myeloproliferative disorders, for example, myelofibrosis, thrombocythemia, polycythemia vera (PV), essential thrombocythemia (ET), agnogenic myeloid metaplasia (AMM), also referred to as idiopathic myelofibrosis (IMF), and chronic myelogenous leukemia (CML); and cancer, for example, ovarian cancer, cervical cancer, breast cancer, colorectal cancer, glioblastomas, prostrate, colon, melanoma, leukemia and haematopoietic malignancies, as described above, in which JAK-2 activity contributes to the pathology and/or symptomatology of the disease.

Suitable in vitro assays for measuring JAK-2 activity and the inhibition thereof by compounds are known. For further details of an in vitro assay for measuring JAK-2 activity see Biological Examples.

Assays for measurement of efficacy in treatment of various cancers are described in Biological Examples.

Suitable in vivo models of various cancers are known to those of ordinary skill in the art. For further details of in vivo assays see Biological Examples.

Synthetic Procedures for JAK-2 Compounds

The JAK-2 compounds of the invention, or their pharmaceutically acceptable salts, can have asymmetric carbon atoms, oxidized sulfur atoms or quaternized nitrogen atoms in their structure.

The JAK-2 compounds of the invention and their pharmaceutically acceptable salts can exist as single stereoisomers, racemates, and as mixtures of enantiomers and diastereomers. The compounds can also exist as geometric isomers. All such single
stereoisomers, racemates and mixtures thereof, and geometric isomers are intended to be within the scope of this invention.

[0741] It is assumed that when considering generic descriptions of JAK-2 compounds for the purpose of constructing a compound, such construction results in the creation of a stable structure. That is, one of ordinary skill in the art would recognize that theoretically some constructs which would not normally be considered as stable compounds (that is, sterically practical and/or synthetically feasible).

[0742] Methods for the preparation and/or separation and isolation of single stereoisomers from racemic mixtures or non-racemic mixtures of stereoisomers are well known in the art. For example, optically active (R)- and (S)- isomers can be prepared using chiral synthons or chiral reagents, or resolved using conventional techniques. Enantiomers (R- and S-isomers) can be resolved by methods known to one of ordinary skill in the art, for example by: formation of diastereoisomeric salts or complexes which can be separated, for example, by crystallization; via formation of diastereoisomeric derivatives which can be separated, for example, by crystallization, selective reaction of one enantiomer with an enantiomer-specific reagent, for example enzymatic oxidation or reduction, followed by separation of the modified and unmodified enantiomers; or gas-liquid or liquid chromatography in a chiral environment, for example on a chiral support, such as silica with a bound chiral ligand or in the presence of a chiral solvent. It will be appreciated that where a desired enantiomer is converted into another chemical entity by one of the separation procedures described above, a further step can be required to liberate the desired enantiomeric form. Alternatively, specific enantiomer can be synthesized by asymmetric synthesis using optically active reagents, substrates, catalysts or solvents or by converting on enantiomer to the other by asymmetric transformation. For a mixture of enantiomers, enriched in a particular enantiomer, the major component enantiomer can be further enriched (with concomitant loss in yield) by recrystallization.

[0743] In addition, the JAK-2 compounds can exist in unsolvated as well as solvated forms with pharmaceutically acceptable solvents such as water, ethanol, and the like. In general, the solvated forms are considered equivalent to the unsolvated forms for the purposes of the present invention.

[0744] In addition, it is intended that the JAK-2 compounds are made either using standard organic synthetic techniques, including combinatorial chemistry or by biological methods, such as bacterial digestion, metabolism, enzymatic conversion, and the like.
Scheme 1 for the JAK-2 compounds below depicts the general synthetic procedure for the JAK-2 compounds. Synthesis of the JAK-2 compounds is not limited by the procedure of Scheme 1. One skilled in the art will know that other procedures can be used to synthesize the JAK-2 compounds, and that the procedure described in Scheme 1 is only one such procedure. In the descriptions below, one of ordinary skill in the art would recognize that specific reaction conditions, added reagents, solvents, and reaction temperatures can be modified for the synthesis of the JAK-2 compounds described herein. Thus, the general synthetic procedure depicted in Scheme 1 in conjunction with the specific examples that follow provide sufficient information and guidance to allow one of ordinary skill in the art to synthesize the JAK-2 compounds.

Compounds of formula I(J) can be prepared according to Scheme 1:

The synthesis of compounds of Formula I(J) proceeds from commercially available reagents and employs standard techniques. Standard Suzuki coupling reactions
conditions can be used to convert dichloropyrimindines of formula A (commercially available from Sigma Aldrich) and boronic acids of formula B (commercially available from Sigma Aldrich, Fisher Scientific, or Combi-Blocks Inc.), where R²⁵, Z and and n₁ are as defined in the Detailed Description of the Invention, to 4-substituted-2-chloropyrimindes of formula C. Compounds of Formula D₁ and I can be generated by reaction of C with the corresponding amines (F₁, available from Fluka) or anilines (F₂, available from Sigma Aldrich). Compounds of formula D₁ can be further transformed to amides of formula E using standard peptide coupling conditions with carboxylic acids or reaction with acid chlorides. For instance, D₁ can be reacted with an intermediate of formula LG¹C(O)R⁴ where LG¹ is a leaving group under acylation conditions and R⁴ is phenyl optionally substituted with 1, 2, 3, 4, or 5 R¹¹ groups, wherein R¹¹ is as defined in the Detailed Description of the Invention to yield a compound of formula E.

**ASSAYS FOR JAK-2 COMPOUNDS**

**Assay Example 1**

*Measurement of JAK-2 Kinase Activity by ATP Hydrolysis*

[01721] JAK-2 kinase activity was measured by monitoring peptide substrate dependent hydrolysis of ATP via quantitation of remaining ATP with luciferase based chemiluminescence. For compound evaluation, 0.5 µl of the compound dissolved in DMSO
was added to 10 µl of JAK-2 dissolved in assay buffer (20 mM HEPES pH 7.5, 10 mM MgCl₂, 0.03% Triton and 1mM DTT). After preincubation for 30 minutes at room temperature, the reaction was initiated by addition of 10 µl of ATP and the substrate peptide poly-Glu-Tyr in assay buffer. Final enzyme, ATP, and peptide concentrations were 3 nM, 1 µM, and 2 µM, respectively. After incubation for 60 minutes at room temperature, reaction progress was quantitated by addition of 10 µl Kinase-Glo (Promega) and measurement of chemiluminescence in a Victor reader (Perkin Elmer). A reaction in which compound was omitted was used to determine maximum reaction progress. Omission of compound and enzyme from the reaction was used to determine zero reaction progress.

Assay Example 2

Measurement of JAK-3 Kinase Activity by ATP Hydrolysis

JAK-3 was assayed similarly as JAK-2 (see Assay Example 1) except that the enzyme reaction was carried out for 180 minutes and enzyme, ATP, and peptide concentrations were 30 nM, 2 µM, and 4 µM, respectively.

Biological Activity

JAK compounds in Table 2 were determined to have inhibitory activity for JAK-2 of less than 10 µM. Other more preferred JAK compounds have inhibitory activity for JAK-2 of less than 100 ran. One of ordinary skill in the art can use the disclosures herein as well as what is known in the art to test the inhibitory activity of a particular compound.

[01737] In certain other embodiments, administration can be by the oral route. Administration of the combination compounds JAK-2 and MEK compounds described herein, or their pharmaceutically acceptable salts, in pure form or in an appropriate pharmaceutical composition, can be carried out via any of the accepted modes of administration or agents for serving similar utilities. Thus, administration can be, for example, orally, nasally, parenterally (intravenous, intramuscular, or subcutaneous), topically, transdermally, intravaginally, intravescically, intracistemally, or rectally, in the form of solid, semi-solid, lyophilized powder, or liquid dosage forms, such as for example, tablets, suppositories, pills, soft elastic and hard gelatin capsules, powders, solutions, suspensions, or aerosols, or the like, preferably in unit dosage forms suitable for simple administration of precise dosages.

[01738] The compositions will include a conventional pharmaceutical carrier or excipient and a JAK-2 and/or MEK compound described herein as the active agent(s), and, in addition, may include carriers and adjuvants, etc.

[01739] Adjuvants include preserving, wetting, suspending, sweetening, flavoring, perfuming, emulsifying, and dispensing agents. Prevention of the action of microorganisms can be ensured by various antibacterial and antifungal agents, for example, parabens, chlorobutanol, phenol, sorbic acid, and the like. It may also be desirable to include isotonic agents, for example sugars, sodium chloride, and the like. Prolonged absorption of the
injectable pharmaceutical form can be brought about by the use of agents delaying absorption, for example, aluminum monostearate and gelatin.

[01740] If desired, a pharmaceutical composition described herein may also contain minor amounts of auxiliary substances such as wetting or emulsifying agents, pH buffering agents, antioxidants, and the like, such as, for example, citric acid, sorbitan monolaurate, triethanolamine oleate, butylated hydroxytoluene, etc.

[01741] The choice of formulation depends on various factors such as the mode of drug administration (e.g., for oral administration, formulations in the form of tablets, pills or capsules are preferred) and the bioavailability of the drug substance. Recently, pharmaceutical formulations have been developed especially for drugs that show poor bioavailability based upon the principle that bioavailability can be increased by increasing the surface area i.e., decreasing particle size. For example, U.S. Pat. No. 4,107,288 describes a pharmaceutical formulation having particles in the size range from 10 to 1,000 nm in which the active material is supported on a crosslinked matrix of macromolecules. U.S. Pat. No. 5,145,684 describes the production of a pharmaceutical formulation in which the drug substance is pulverized to nanoparticles (average particle size of 400 nm) in the presence of a surface modifier and then dispersed in a liquid medium to give a pharmaceutical formulation that exhibits remarkably high bioavailability.

[01742] Compositions suitable for parenteral injection may comprise physiologically acceptable sterile aqueous or nonaqueous solutions, dispersions, suspensions or emulsions, and sterile powders for reconstitution into sterile injectable solutions or dispersions. Examples of suitable aqueous and nonaqueous carriers, diluents, solvents or vehicles include water, ethanol, polyls (propylene glycol, polyethylene glycol, glycerol, and the like), suitable mixtures thereof, vegetable oils (such as olive oil) and injectable organic esters such as ethyl oleate. Proper fluidity can be maintained, for example, by the use of a coating such as lecithin, by the maintenance of the required particle size in the case of dispersions and by the use of surfactants.

[01743] One specific route of administration is oral, using a convenient daily dosage regimen that can be adjusted according to the degree of severity of the disease-state to be treated.

[01744] Solid dosage forms for oral administration include capsules, tablets, pills, powders, and granules. In such solid dosage forms, the active compound is admixed with at least one inert customary excipient (or carrier) such as sodium citrate or dicalcium phosphate or (a) fillers or extenders, as for example, starches, lactose, sucrose, glucose, mannitol, and silicic
(b) binders, as for example, cellulose derivatives, starch, alignates, gelatin, polyvinylpyrrolidone, sucrose, and gum acacia, (c) humectants, as for example, glycerol, (d) disintegrating agents, as for example, agar-agar, calcium carbonate, potato or tapioca starch, alginic acid, croscarmellose sodium, complex silicates, and sodium carbonate, (e) solution retarders, as for example paraffin, (f) absorption accelerators, as for example, quaternary ammonium compounds, (g) wetting agents, as for example, cetyl alcohol, and glycerol monostearate, magnesium stearate and the like (h) adsorbents, as for example, kaolin and bentonite, and (i) lubricants, as for example, talc, calcium stearate, magnesium stearate, solid polyethylene glycols, sodium lauryl sulfate, or mixtures thereof. In the case of capsules, tablets, and pills, the dosage forms may also comprise buffering agents.

Solid dosage forms as described above can be prepared with coatings and shells, such as enteric coatings and others well known in the art. They may contain pacifying agents, and can also be of such composition that they release the active compound or compounds in a certain part of the intestinal tract in a delayed manner. Examples of embedded compositions that can be used are polymeric substances and waxes. The active MEK or JAK-2 compounds described herein can also be in microencapsulated form, if appropriate, with one or more of the above-mentioned excipients.

Liquid dosage forms for oral administration include pharmaceutically acceptable emulsions, solutions, suspensions, syrups, and elixirs. Such dosage forms are prepared, for example, by dissolving, dispersing, etc., a MEK or JAK-2 compound(s) described herein, or a pharmaceutically acceptable salt thereof, and optional pharmaceutical adjuvants in a carrier, such as, for example, water, saline, aqueous dextrose, glycerol, ethanol and the like; solubilizing agents and emulsifiers, as for example, ethyl alcohol, isopropyl alcohol, ethyl carbonate, ethyl acetate, benzyl alcohol, benzyl benzoate, propylene glycol, 1,3-butylene glycol, dimethylformamide; oils, in particular, cottonseed oil, groundnut oil, corn germ oil, olive oil, castor oil and sesame oil, glycerol, tetrahydrofurfuryl alcohol, polyethylene glycols and fatty acid esters of sorbitan; or mixtures of these substances, and the like, to thereby form a solution or suspension.

Suspensions, in addition to the active MEK or JAK-2 compounds, may contain suspending agents, as for example, ethoxylated isostearyl alcohols, polyoxyethylene sorbitol and sorbitan esters, microcrystalline cellulose, aluminum metahydroxide, bentonite, agar-agar and tragacanth, or mixtures of these substances, and the like.

Compositions for rectal administrations are, for example, suppositories that can be prepared by mixing the MEK or JAK-2 compounds described herein with, for example,
suitable non-irritating excipients or carriers such as cocoa butter, polyethylene-glycol or a suppository wax, which are solid at ordinary temperatures but liquid at body temperature and therefore, melt while in a suitable body cavity and release the active component therein.

[01749] Dosage forms for topical administration of a MEK or JAK-2 compound described herein include ointments, powders, sprays, and inhalants. The active component is admixed under sterile conditions with a physiologically acceptable carrier and any preservatives, buffers, or propellants as may be required. Ophthalmic formulations, eye ointments, powders, and solutions are also contemplated as being within the scope of this invention.

[01750] Compressed gases may be used to disperse a MEK or JAK-2 compound described herein in aerosol form. Inert gases suitable for this purpose are nitrogen, carbon dioxide, etc.

[01751] Generally, depending on the intended mode of administration, the pharmaceutically acceptable compositions will contain about 1% to about 99% by weight of a MEK or JAK-2 compound(s) described herein, or a pharmaceutically acceptable salt thereof, and 99% to 1% by weight of a suitable pharmaceutical excipient. In one example, the composition will be between about 5% and about 75% by weight of a MEK or JAK-2 compound(s) described herein, or a pharmaceutically acceptable salt thereof, with the rest being suitable pharmaceutical excipients.

[01752] Actual methods of preparing such dosage forms are known, or will be apparent, to those skilled in this art; for example, see Remington's Pharmaceutical Sciences, 18th Ed., (Mack Publishing Company, Easton, Pa., 1990). The composition or compositions to be administered will, in any event, contain a therapeutically effective amount of a JAK-2 compound and a MEK compound described herein, or a pharmaceutically acceptable salt thereof, for treatment of a disease-state in accordance with the teachings of this invention.

[01753] The MEK or JAK-2 compounds described herein, or their pharmaceutically acceptable salts or hydrates, are administered in a therapeutically effective amount which will vary depending upon a variety of factors including the activity of the specific compounds employed, the metabolic stability and length of action of the compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular disease-states, and the host undergoing therapy. The JAK-2 and MEK compounds described herein can be administered to a patient at dosage levels in the range of about 0.1 to about 1,000 mg per day. For a normal human adult having a body weight of about 70 kilograms, a dosage in the range of about 0.01 to about 100 mg per kilogram of body weight per day is an example. The specific dosage used, however, can vary. For example, the dosage can depend on a number of factors including the
requirements of the patient, the severity of the condition being treated, and the pharmacological activity of the compound being used. The determination of optimum dosages for a particular patient is well known to one of ordinary skill in the art.

[01754] If formulated as a fixed dose, such combination products employ the MEK and JAK-2 compounds described herein within the dosage range described above and the other pharmacologically active agent(s) within its approved dosage range. The MEK and JAK-2 compounds described herein may alternatively be used sequentially with known pharmaceutically acceptable agent(s) when combined with other chemotherapeutic, or otherwise active agents.

[01755] Representative pharmaceutical formulations containing a MEK and/or JAK-2, either by themselves or in combination, are described herein above.
