**FUSED TRICYCLIC AMIDE COMPOUNDS AS MULTIPLE KINASE INHIBITORS**

Disclosed herein are fused tricyclic amide compounds, pharmaceutical compositions comprising at least one such fused tricyclic amide compound, processes for the preparation thereof, and the use thereof in therapy. Disclosed herein are certain tricyclic amide compounds that can be useful for inhibiting multiple (specifically BRAF and/or EGFR-T790M) kinases and for treating disorders mediated thereby.

The EGFR/RAF/MEK/ERK pathway is of interest for cell survival, growth, proliferation and tumorigenesis (Zebisch et al., *Curr Med Chem.* 14(5): 601-623, 2007; Roberts and Der, *Oncogene* 26 (22): 3291-3310, 2007; Montagut and Settleman, *Cancer Lett.* 283(2): 125-134, 2009). Stimulation of the EGFR/RAF/MEK/ERK signal transduction pathway may occur after binding of a ligand to the membrane-bound receptor tyrosine kinase. GTP-bound RAS can be activated, which can subsequently promote the activation of the Raf family proteins (A-Raf, B-Raf and Raf1, formerly known as C-Raf) (Wellbrock et al., *Nat. Rev. Mol. Cell Biol.* 5: 875-885, 2004). Mutations in various RAS GTPases and B-Raf kinase in the EGFR/RAF/MEK/ERK signal pathway have been reported to constitutively activate the MAPK pathway, resulting in increased cell division and survival (Bos, *Cancer Res.* 49: 4682-4689, 1989; Hoshino et al., *Oncogene*. 18(3): 813-822, 1999). For example, B-Raf mutations are reportedly found in a large percentage of human melanomas and thyroid cancers (Davies et al., *Nature* 417: 949-954, 2002) (Cohen et al., *J. Nat. Cancer Inst.* 95(8): 625-627, 2003; Kimura et al., *Cancer Res.* 63(7): 1454-1457, 2003; Pollock and Meltzer, *Cancer Cell* 2: 5-7, 2002). In addition, lower, but still significant frequency of B-Raf mutations have been reported in Barret's adenocarcinoma (Garnett et al., *Cancer Cell* 6: 313-319, 2004; Sommerer et al., *Oncogene* 23(2): 554-558, 2004), breast cancer (Davies et al., *Nature* 417: 949-954, 2002), cervical cancer (Moreno-Bueno et al., *Clin. Cancer Res.* 12(12): 365-3866, 2006), cholangiocarcinoma (Tannapfel et al., *Gut*. 52(5): 706-712, 2003), glioblastoma (Knobbe et al., *Acta Neuropathol. (Berl.)*. 108(6): 467-470, 2004), colorectal cancer (Yuen et al., *Cancer Res.* 62(22): 6451-6455, 2002; Davies et al., *Nature* 417: 949-954, 2002), gastric cancer (Lee et al., *Oncogene* 22(44): 6942-6945), lung cancer (Brose et al., *Cancer Res.* 62(23): 6997-7000, 2002), ovarian cancer (Russell and McCluggage, *J. Pathol.* 203(2): 617-619, 2004; Davies et al., *Nature* 417: 949-954, 2002), pancreatic cancer (Ishimura et al., *Cancer Lett.* 199(2): 169-173, 2003), prostate cancer (Cho et al., *Int. J. Cancer.* 119(8): 1858-1862, 2006), and hematologic cancers (Garnett and Marais, *Cancer Cell* 6: 313-319, 2004). These reports suggest that B-Raf is one of the most frequently mutated genes in human cancers. B-Raf kinase can represent an

excellent target for anticancer therapy based on preclinical target validation, epidemiology and drugability.

Inhibitors of Raf kinases have been discussed for use in disruption of tumor cell growth and hence in the treatment of cancers, e.g. melanoma, colorectal cancer including large 5 intestinal colon carcinoma, histiocytic lymphoma, lung adenocarcinoma, small cell lung cancer, and pancreatic and breast carcinoma (Crump, Current Pharmaceutical Design 8: 2243-2248, 2002; Sebastien et al., Current Pharmaceutical Design 8: 2249-2253, 2002), and /or in the treatment or prophylaxis of disorders associated with neuronal degeneration resulting from ischemic events, including cerebral ischemia after cardiac arrest, stroke and multi-infarct 10 dementia. Inhibitors of Raf kinases have also been discussed for use after cerebral ischemic events such as those resulting from head injury, surgery and /or during childbirth (York et al., Mol. and Cell. Biol. 20(21): 8069-8083, 2000; Chin et al., Neurochem. 90: 595-608, 2004), as well as in polycystic kidney disease (Nagao et al., Kidney Int. 63(2): 427-437, 2003).

In addition, certain hyperproliferative disorders may be characterized by the over 15 activation of Raf kinase functions, for example, by mutations or over expression of the protein. Accordingly, inhibitors of Raf kinases can be useful in the treatment of hyperproliferative disorders, such as cancer.

Small molecule inhibitors of B-Raf kinases are being developed for anticancer therapy. 20 Nexavar® (sorafenib tosylate) is a multikinase inhibitor, which includes inhibition of B-Raf kinases, and is approved for the treatment of patients with advanced renal cell carcinoma and unresectable hepatocellular carcinoma. More selective small molecule inhibitors of B-Raf kinases such as venumrafenib and dabrafenib have recently approved for the treatment of patients with metastatic melanoma with B-Raf V600E mutations. Other Raf inhibitors have also been disclosed or have entered clinical trials, for example SB-590885, RAF-265, PLX- 25 4032, GSK2118436 and XL-281.

Other B-Raf inhibitors are also known. See, for example, U.S. Patent Application Publication 2006/0189627, U.S. Patent Application Publication 2006/0281751, U.S. Patent Application Publication 2007/0049603, International Patent Application Publication WO 2007/002325, International Patent Application Publication WO 2007/002433, International 30 Patent Application Publication WO 03/068773, International Patent Application Publication WO 2007/013896, International Patent Application Publication WO 2011/097526, International Patent Application Publication WO 2011/117382 and International Patent Application Publication WO2012/118492

Certain nitrogen-containing heteroaryl-substituted aryl bicyclic compounds have been identified as Raf inhibitors. See, for example, International Patent Application Publication WO 2007/067444 and U.S. Patent Application Publication 2010/0197924.

Certain Raf kinase inhibitors have also been identified. See, for example, International Patent Application Publication WO 2005/062795, International Patent Application Publication WO 2008/079906, International Patent Application Publication WO 2008/079909, International Patent Application Publication WO 2006/066913, International Patent Application WO 2008/028617, International Patent Application Publication WO 2009/012283, International Patent Application Publication WO 2010/064722 and International Patent Application Publication WO 2011/092088.

Despite the enormous success has been achieved in the treatment of Braf-V600E mutant melanoma with the recently approved Braf inhibitors such as vemurafenib and dabrafenib, the treatment of Braf-V600E mutant CRCs with Braf inhibitors has been elusive. In a study published in 2012, investigators conducted a synthetic lethal screen of *BRAF*-mutant colorectal cancer cells that were resistant to vemurafenib and ultimately revealed that *BRAF* inhibition by vemurafenib caused rapid feedback activation of epidermal growth factor receptor (EGFR), which supported continued proliferation in the presence of *BRAF* inhibition (Prahalla A, et al, *Nature* 483:100-103, 2012). The researchers showed that if you suppressed EGFR with cetuximab, erlotinib (Tarceva), or gefitinib (Iressa), added to vemurafenib, *BRAF*-mutant colorectal cancer was inhibited in both in vitro and in vivo models, suggesting that combination therapy with *BRAF* and EGFR inhibitors may be more effective in this patient population. This was corroborated by another group, which showed that the combination of vemurafenib and erlotinib led to tumor regression in colorectal cancer cell line xenografts and reduction of the proliferative marker Ki67 (Corcoran RB, et al, *Cancer Discovery* 3:227-235, 2012).

Data are becoming consistent, therefore, that EGFR or other receptor tyrosine kinases may mediate resistance to vemurafenib, and that combinations with an EGFR or MEK inhibitor may produce greater suppression of tumor growth.

Many human tumors are characterized by hyperactivity of protein kinases. The inhibition of these enzymes has been established as a cancer treatment in recent years. Given the great success of this therapeutic strategy, the search for additional protein kinase inhibitors is one of the major research topics in the oncology drug development area (S. Grant, *Cell. Mol. Life Sci.* 66 (2009) 1163-1177; J. Zhang, P. Yang, N. Gray, *Nat. Rev. Cancer* 9 (2009) 28-39). While in the beginning of the protein kinase inhibitor era selectivity towards a single target enzyme appeared desirable, it is now generally accepted that inhibiting more than one tumor-related

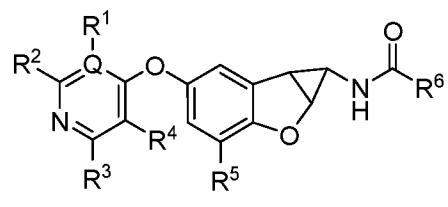

protein kinase at a time offers the advantage of hitting the tumour in multiple aspects (L. Gossage, T. Eisen, Clin. Cancer Res. 16 (2010) 1973-1978; A. Petrelli, S. Giordano, Curr. Med. Chem. 15 (2008) 422-432). Among other advantages, the *aspecificity* of drugs targeting several kinases may lead to a lower risk of drug-resistance development (L. Gossage, T. Eisen, Clin. 5 Cancer Res. 16 (2010) 1973-1978; A. Petrelli, S. Giordano, Curr. Med. Chem. 15 (2008) 422-432). Multikinase inhibitors launched recently as anticancer drugs comprise sunitinib (D.B. Mendel, et al, Clin. Cancer Res. 9 (2003) 327-337), sorafenib (S. Wilhelm, et al, Nat. Rev. Drug Discov. 5 (2006) 835-844) and dasatinib (Yeatman TJ, Nat Rev Cancer 2004; 4:470-480). Albeit namely the latter was reported as an inhibitor of human protein kinases with high 10 promiscuity, the undesired side effects of the drug are tolerable.

A single compound which inhibits a combination of several targets, such as RAFs and EGFRs (in particular EGFR-T790M), offer the advantage of inhibiting a combination of several signal transduction pathways, thereby interfering with several oncogenic processes, while making the treatment easier and improving the patients comfort. It would be desirable to 15 generate small molecule kinase inhibitor molecules able to simultaneously inhibit RAFs and EGFRs (in particular EGFR-T790M).

By combining a dual inhibitory activity, such as RAFs and EGFRs (in particular EGFR-T790M), in a single molecule, the advantage resides in (i) reducing the risks related to off-target toxicity encountered when two or more different kinase inhibitors targeting RAFs and 20 EGFRs (in particular EGFR-T790M) are administered, (ii) reducing the costs of treatment, (iii) increasing the patients compliance.

Accordingly, the present invention aims to provide compounds which simultaneously inhibit several key signal transduction pathways.

As used herein, the following words, phrases and symbols are generally intended to have  
10 the meanings as set forth below, except to the extent that the context in which they are used indicates otherwise. The following abbreviations and terms have the indicated meanings throughout:

The term "alkyl" herein refers to a hydrocarbon group selected from linear and branched saturated hydrocarbon groups comprising from 1 to 18, such as from 1 to 12, further such as  
15 from 1 to 6, carbon atoms. Examples of the alkyl group can be selected from methyl, ethyl, 1-propyl or n-propyl ("n-Pr"), 2-propyl or isopropyl ("i-Pr"), 1-butyl or n-butyl ("n-Bu"), 2-methyl-1-propyl or isobutyl ("i-Bu"), 1-methylpropyl or s-butyl ("s-Bu"), and 1,1-dimethylethyl or t-butyl ("t-Bu"). The term "alkenyl" herein refers to a hydrocarbon group selected from linear and branched hydrocarbon groups comprising at least one C=C double bond and from 2 to 18, such  
30 as from 2 to 6, carbon atoms. Examples of the alkenyl group may be selected from ethenyl or vinyl (--CH=CH<sub>2</sub>), prop-1-enyl (--CH=CHCH<sub>3</sub>), prop-2-enyl (--CH<sub>2</sub>CH=CH<sub>2</sub>), 2-methylprop-1-enyl, but-1-enyl, but-2-enyl, but-3-enyl, buta-1,3-dienyl, 2-methylbuta-1,3-dienyl, hex-1-enyl, hex-2-enyl, hex-3-enyl, hex-4-enyl, and hexa-1,3-dienyl groups.

The term "alkynyl" herein refers to a hydrocarbon group selected from linear and  
35 branched hydrocarbon group, comprising at least one C≡C triple bond and from 2 to 18, such

as from 2 to 6, carbon atoms. Examples of the alkynyl group include ethynyl ( $\text{--C}\equiv\text{CH}$ ), 1-propynyl ( $\text{-C}\equiv\text{CCH}_3$ ), 2-propynyl (propargyl,  $\text{-CH}_2\text{C}\equiv\text{CH}$ ), 1-butynyl, 2-butynyl, and 3-butynyl groups.

The term "cycloalkyl" herein refers to a hydrocarbon group selected from saturated and partially unsaturated cyclic hydrocarbon groups, comprising monocyclic and polycyclic (e.g., bicyclic and tricyclic) groups. For example, the cycloalkyl group may comprise from 3 to 12, such as 3 to 8, further such as 3 to 6, 3 to 5, or 3 to 4 carbon atoms. Even further for example, the cycloalkyl group may be selected from monocyclic group comprising from 3 to 12, such as 3 to 8, 3 to 6 carbon atoms. Examples of the monocyclic cycloalkyl group include cyclopropyl, cyclobutyl, cyclopentyl, 1-cyclopent-1-enyl, 1-cyclopent-2-enyl, 1-cyclopent-3-enyl, cyclohexyl, 1-cyclohex-1-enyl, 1-cyclohex-2-enyl, 1-cyclohex-3-enyl, cyclohexadienyl, cycloheptyl, cyclooctyl, cyclononyl, cyclodecyl, cycloundecyl, and cyclododecyl groups. Examples of the bicyclic cycloalkyl groups include those having from 7 to 12 ring atoms arranged as a bicyclic ring selected from [4,4], [4,5], [5,5], [5,6] and [6,6] ring systems, or as a bridged bicyclic ring selected from bicyclo[2.2.1]heptane, bicyclo[2.2.2]octane, and bicyclo[3.2.2]nonane. The ring may be saturated or have at least one double bond (i.e. partially unsaturated), but is not fully conjugated, and is not aromatic, as aromatic is defined herein.

The term "Aryl" herein refers to a group selected from:

5- and 6-membered carbocyclic aromatic rings, for example, phenyl;

bicyclic ring systems such as 7 to 12 membered bicyclic ring systems wherein at least one ring is carbocyclic and aromatic, selected, for example, from naphthalene, indane, and 1,2,3,4-tetrahydroquinoline; and

tricyclic ring systems such as 10 to 15 membered tricyclic ring systems wherein at least one ring is carbocyclic and aromatic, for example, fluorene.

For example, the aryl group is selected from 5 and 6-membered carbocyclic aromatic rings fused to a 5- to 7-membered cycloalkyl or heterocyclic ring optionally comprising at least one heteroatom selected from N, O, and S, provided that the point of attachment is at the carbocyclic aromatic ring when the carbocyclic aromatic ring is fused with a heterocyclic ring, and the point of attachment can be at the carbocyclic aromatic ring or at the cycloalkyl group when the carbocyclic aromatic ring is fused with a cycloalkyl group. Bivalent radicals formed from substituted benzene derivatives and having the free valences at ring atoms are named as substituted phenylene radicals. Bivalent radicals derived from univalent polycyclic hydrocarbon radicals whose names end in "-yl" by removal of one hydrogen atom from the carbon atom with the free valence are named by adding "-idene" to the name of the corresponding univalent radical, e.g., a naphthyl group with two points of attachment is termed

naphthylidene. Aryl, however, does not encompass or overlap in any way with heteroaryl, separately defined below. Hence, if one or more carbocyclic aromatic rings are fused with a heterocyclic aromatic ring, the resulting ring system is heteroaryl, not aryl, as defined herein.

The term "halogen" or "halo" herein refers to F, Cl, Br or I.

5 The term "heteroaryl" herein refers to a group selected from:

5- to 7-membered aromatic, monocyclic rings comprising at least one heteroatom, for example, from 1 to 4, or, in some embodiments, from 1 to 3, heteroatoms, selected from N, O, and S, with the remaining ring atoms being carbon;

10 8- to 12-membered bicyclic rings comprising at least one heteroatom, for example, from 1 to 4, or, in some embodiments, from 1 to 3, or, in other embodiments, 1 or 2, heteroatoms, selected from N, O, and S, with the remaining ring atoms being carbon and wherein at least one ring is aromatic and at least one heteroatom is present in the aromatic ring; and

15 11- to 14-membered tricyclic rings comprising at least one heteroatom, for example, from 1 to 4, or in some embodiments, from 1 to 3, or, in other embodiments, 1 or 2, heteroatoms, selected from N, O, and S, with the remaining ring atoms being carbon and wherein at least one ring is aromatic and at least one heteroatom is present in an aromatic ring.

20 For example, the heteroaryl group includes a 5- to 7-membered heterocyclic aromatic ring fused to a 5- to 7-membered cycloalkyl ring. For such fused, bicyclic heteroaryl ring systems wherein only one of the rings comprises at least one heteroatom, the point of attachment may be at the heteroaromatic ring or at the cycloalkyl ring.

Compounds described herein may contain an asymmetric center and may thus exist as enantiomers. Where the compounds described herein possess two or more asymmetric centers,

15 they may additionally exist as diastereomers. Enantiomers and diastereomers fall within the broader class of stereoisomers. All such possible stereoisomers as substantially pure resolved enantiomers, racemic mixtures thereof, as well as mixtures of diastereomers are intended to be included. All stereoisomers of the compounds disclosed herein and /or pharmaceutically acceptable salts thereof are intended to be included. Unless specifically mentioned otherwise, 20 reference to one isomer applies to any of the possible isomers. Whenever the isomeric composition is unspecified, all possible isomers are included.

The term "substantially pure" as used herein means that the target stereoisomer contains no more than 35%, such as no more than 30%, further such as no more than 25%, even further such as no more than 20%, by weight of any other stereoisomer(s). In some embodiments, the 25 term "substantially pure" means that the target stereoisomer contains no more than 10%, for example, no more than 5%, such as no more than 1%, by weight of any other stereoisomer(s).

When compounds described herein contain olefinic double bonds, unless specified otherwise, such double bonds are meant to include both E and Z geometric isomers.

Some of the compounds described herein may exist with different points of attachment of 30 hydrogen, referred to as tautomers. For example, compounds including carbonyl -CH<sub>2</sub>C(O)- groups (keto forms) may undergo tautomerism to form hydroxyl -CH=C(OH)- groups (enol

forms). Both keto and enol forms, individually as well as mixtures thereof, are also intended to be included where applicable.

It may be advantageous to separate reaction products from one another and /or from starting materials. The desired products of each step or series of steps is separated and /or purified (hereinafter separated) to the desired degree of homogeneity by the techniques common in the art. Typically such separations involve multiphase extraction, crystallization from a solvent or solvent mixture, distillation, sublimation, or chromatography. Chromatography can involve any number of methods including, for example: reverse-phase and normal phase; size exclusion; ion exchange; high, medium and low pressure liquid chromatography methods and apparatus; small scale analytical; simulated moving bed ("SMB") and preparative thin or thick layer chromatography, as well as techniques of small scale thin layer and flash chromatography. One skilled in the art will apply techniques most likely to achieve the desired separation.

Diastereomeric mixtures can be separated into their individual diastereomers on the basis of their physical chemical differences by methods well known to those skilled in the art, such as by chromatography and /or fractional crystallization. Enantiomers can be separated by converting the enantiomeric mixture into a diastereomeric mixture by reaction with an appropriate optically active compound (e.g., chiral auxiliary such as a chiral alcohol or Mosher's acid chloride), separating the diastereomers and converting (e.g., hydrolyzing) the individual diastereoisomers to the corresponding pure enantiomers. Enantiomers can also be separated by use of a chiral HPLC column.

A single stereoisomer, e.g., a substantially pure enantiomer, may be obtained by resolution of the racemic mixture using a method such as formation of diastereomers using optically active resolving agents (Eliel, E. and Wilen, S. *Stereochemistry of Organic Compounds*. New York: John Wiley & Sons, Inc., 1994; Lochmuller, C. H., et al. "Chromatographic resolution of enantiomers: Selective review." *J. Chromatogr.*, 113(3) (1975): pp. 283-302). Racemic mixtures of chiral compounds of the invention can be separated and isolated by any suitable method, including: (1) formation of ionic, diastereomeric salts with chiral compounds and separation by fractional crystallization or other methods, (2) formation of diastereomeric compounds with chiral derivatizing reagents, separation of the diastereomers, and conversion to the pure stereoisomers, and (3) separation of the substantially pure or enriched stereoisomers directly under chiral conditions. Similarly, examples of pharmaceutically acceptable cations include, but are not limited to, sodium, potassium, calcium, aluminum, lithium, and ammonium.

In addition, if a compound disclosed herein is obtained as an acid addition salt, the free base can be obtained by basifying a solution of the acid salt. Conversely, if the product is a free base, an addition salt, such as a pharmaceutically acceptable addition salt, may be produced by dissolving the free base in a suitable organic solvent and treating the solution with an acid, in accordance with conventional procedures for preparing acid addition salts from base compounds. Those skilled in the art will recognize various synthetic methodologies that may be used without undue experimentation to prepare non-toxic pharmaceutically acceptable addition salts.

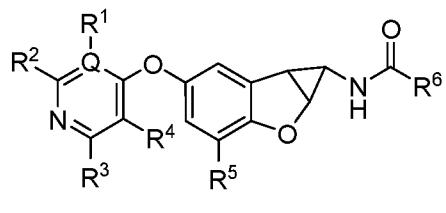

As defined herein, "pharmaceutically acceptable salts thereof" include salts of at least one compound of Formulae I and II, and salts of the stereoisomers of at least one compound of Formulae I and II, such as salts of enantiomers, and /or salts of diastereomers.

stereoisomers thereof, and pharmaceutically acceptable salts thereof:

The compounds disclosed herein, and /or the pharmaceutically acceptable salts thereof, can be synthesized from commercially available starting materials taken together with the  
5 disclosure herein. The following scheme illustrates methods for preparation of some of the compounds disclosed herein.

**Scheme I**

In this scheme, a commercially available 4-methoxyphenol is reacted with 2-bromo-1,1-diethoxyethane to form formula 2, then the ring is closed in the presence of acidic condition to give 5-methoxybenzofuran. Then the methyl group is removed and the hydroxy group of formula 4 is protected with a hydroxy protecting group (such as methyl, ethyl, isopropyl, benzyl, p-methoxybenzyl, trityl, methoxymethyl, tetrahydropyranyl acetyl, benzoate, trimethylsilyl, triethylsilyl, tri-isopropylsilyl, tert-butyldimethylsilyl or tert-butyldiphenylsilyl, further such as benzyl from benzyl bromide, and tert-butyldiphenylsilyl from TBSCl) to provide a protected hydroxybenzofuran of formula 5. The compound of formula 5 is reacted with alkyl diazo-acetate (such as ethyl diazo-acetate) in the presence of a Rh or Cu catalyst to provide a cyclopropane derivative of formula 6. The chiral derivative of formula 6 may be

obtained by using a chiral catalyst formed in situ from Cu(OOCCF<sub>3</sub>)<sub>2</sub> and a chiral amino alcohol or by using a commercially available chiral Rh catalyst. The compound of formula 6 is deprotected as described above to provide a phenol derivative (for example, the TMS protecting group may be removed by treating with HCl/EtOH). Formula 7 can be obtained 5 using simple recrystallization. The resulting phenol derivative of formula 7 is reacted with haloheteroaryl derivative (such as fluoro-substituted teroaryl derivative) to provide a compound of formula 8, which subsequently is hydrolyzed into the free acid of formula 9 by using a base such as sodium hydroxide. A compound of formula 9 is reacted with DPPA (diphenylphosphoryl azide) to form formula 10, which is rearranged to afford the Boc 10 protected amine 11 in the presence of *tert*-butanol. Then Boc group is removed under acidic condition such as TFA or HCl. The further coupling of the amine 12 is accomplished under standard conditions known in the art to provide a compound of Formula I.

10 **Step A: 1-(2,2-diethoxyethoxy)-4-methoxybenzene**

To a stirred solution of 4-methoxyphenol (500 g, 4 mol) in DMSO (500 mL) was added KOH (400 g, 7.1 mol, 1.78 eq) at room temperature. After stirring for 20 min, the resulted mixture was heated to 120 °C. 2-bromo-1,1-diethoxyethane (850 g, 4.3 mol) was added in 15 drops within 2 hour at this temperature and stirred for another 2 hours. The mixture was treated with water (1000 mL) and PE (1000 mL), filtered through a celite pad. The liquid phase was extracted with PE (500 mL × 2). The combined organics was washed with aqueous NaOH (2 N,

300 mL × 2), brine (500 mL × 3), dried over anhydride sodium sulfate and concentrated under reduced pressure to give the title compound (850 g, 88%) as a light yellow oil which was used into next step directly.  $^1\text{H}$  NMR (400 MHz, DMSO-*d*6)  $\delta$  6.98 – 6.78 (m, 4H), 4.76 (t, *J* = 5.2 Hz, 1H), 3.88 (d, *J* = 5.2 Hz, 2H), 3.71 – 3.68 (m, 3H), 3.69 – 3.61 (m, 2H), 3.60 – 3.50 (m, 2H), 1.17 – 1.10 (m, 6H) ppm.

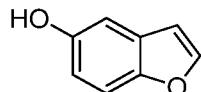

5 Step B: 5-methoxybenzofuran

10 The mixture of the product of Step A (420 g, 1.87 mmol) and Amberlyst 15 (42 g) in toluene (2 L) was stirred at reflux for 6hrs with concomitant azeotrope removal of EtOH generated in the reaction (keep the solvent more than 1.5 L). The resulting reaction mixture was filtered and the resin was washed with an excess of toluene. The combined filtrates were concentrated to dryness under reduced pressure. The crude product was distilled at 100 °C under reduced pressure through a lab oil pump to afford (105 g, 74 °C fraction). The solid was 15 diluted with 1000 mL of PE and washed with NaOH (3 M, 200 mL × 2), brine (500 mL × 3), dried over anhydride sodium sulfate and concentrated under reduced pressure to give the title compounds (85 g, 33%) as a white solid.  $^1\text{H}$  NMR (400 MHz, CDCl<sub>3</sub>)  $\delta$  7.59 (d, *J* = 2.0 Hz, 1H), 7.39 (d, *J* = 9.0 Hz, 1H), 7.05 (d, *J* = 2.4 Hz, 1H), 6.90 (dd, *J* = 9.0, 2.4 Hz, 1H), 6.73 – 6.68 (m, 1H), 3.84 (s, 3H) ppm.

After the addition, the mixture was warmed to 20 °C and stirred for 2 hrs. The reaction mixture was cooled to 0 °C and added into a solution of NH<sub>3</sub>/MeOH (3 mol/L, 500 mL) using a canula at -20 °C over a period of 15 min carefully. The mixture was concentrated and the residue was added EA (500 mL). The solid was filtered off through a silica pad and the filtrate was concentrated under reduced pressure to give the crude product (crude, 48 g) as a oil which was used for the next step directly.  $^1\text{H}$  NMR (400 MHz, DMSO-*d*6)  $\delta$  9.14 (s, 1H), 7.86 (d, *J* = 2.0 Hz, 1H), 7.36 (d, *J* = 8.8 Hz, 1H), 6.94 (d, *J* = 2.4 Hz, 1H), 6.79 (dd, *J* = 2.0, 0.9 Hz, 1H), 6.74 (dd, *J* = 8.8, 2.4 Hz, 1H) ppm. 5 5,6,7,8-tetrahydro-1,8-naphthyridin-4-yl)oxy)-1a,6b-dihydro-1H-cyclopropa[b]benzofuran-1-yl)-3-(trifluoromethyl)benzamide

Step A: 4-benzyl 1-tert-butyl 2,6-dimethylpiperazine-1,4-dicarboxylate

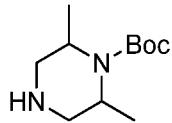

10

To a solution of 2, 6-dimethylpiperazine (1.14 g, 10 mmol) in DCM (10 mL) was added benzylchloroformate (1.5 mL) dropwise at 0 °C. The mixture was stirred at 0 °C for 1 hour then at room temperature for another 2 hours. The mixture was cooled to 0 °C, Diisopropylethylamine (2.5 mL) was added and followed by (Boc)<sub>2</sub>O (2.4 g, 11 mmol). The mixture was stirred at room temperature overnight. The resulting solution was concentrated under reduced pressure. The residue was diluted with water and extracted with EA (5mL×3). The combined organic layer was dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated under reduced pressure. The residue was

purified by silica gel column chromatography (weight of silicon: 3 g; eluted with PE/EA = 10/1) to get the title compound (1.17 g, yield: 33%) as colorless oil. MS: M/e 371 (M+Na)<sup>+</sup>.

Step B: tert-butyl 2,6-dimethylpiperazine-1-carboxylate

A solution of the product of Step A (1.17 g, 3.36 mmol) in methanol (5 mL) was added 117 mg of Pd/C (Palladium 10% on Carbon) and stirred at room temperature under 4 atm H<sub>2</sub> atmosphere overnight. The resulting solution was filtered and the filtrate was concentrated to give the title product (713 mg, yield: 100%) as colorless oil which was used into next step 10 directly.

Step C: tert-butyl 4-(4-(methoxycarbonyl)-2-(trifluoromethyl)benzyl)-2,6-dimethylpiperazine-1-carboxylate

15 A mixture of the product of Step B (309 mg, 1.44 mmol), the product of Step B in synthesis of **Compound 1.1** (357 mg, 1.20 mmol) and triethylamine (242 mg, 2.40 mmol) in DCM (10 mL) was stirred at room temperature for 1 hour. The reaction was completed according to the TLC plate. The resulting solution was concentrated and the residue was purified by silica gel column chromatography (weight of silicon: 3 g; eluted with PE/EA = 5/1) 20 to get the title compound (242 mg, yield: 47%) as yellow oil. MS: M/e 431 (M+1)<sup>+</sup>.

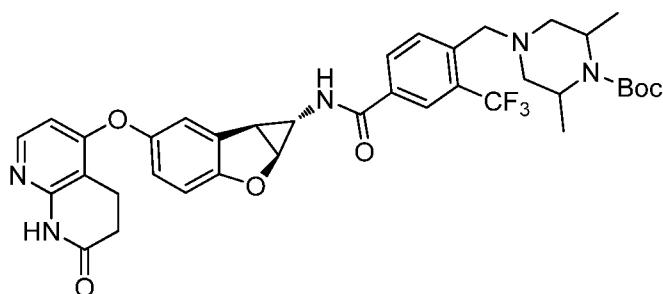

Step D: 4-((4-(tert-butoxycarbonyl)-3,5-dimethylpiperazin-1-yl)methyl)-3-(trifluoromethyl)benzoic acid

25 To a solution of the product of Step C (240 mg, 0.56 mmol) in MeOH (10 mL) was add NaOH aqueous solution (2ml, 2N, 4 mmol). The solution was stirred at room temperature for 0.5 hour and concentrated under reduced pressure. The residue was dissolved into water (2 mL) and modified pH about 5~6 by 2N HCl aqueous solution. The mixture was extracted with

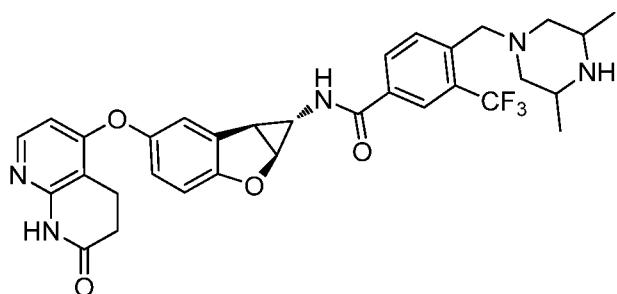

DCM (5mL×3). The combined organic layer was dried over  $\text{Na}_2\text{SO}_4$  and concentrated under reduced pressure to get the crude product (100 mg, yield: 43%) as a yellow solid. MS: M/e 417(M+1)<sup>+</sup>.

10 Raf IC<sub>50</sub> Assay Protocol

Compounds disclosed herein were tested against B-Raf (V600E) (PV3849, from Invitrogen) or C-Raf (Y340D/Y341D) (PV3805, from Invitrogen) in a time-resolved fluorescence energy transfer assay. The assay was carried out in reactions (10 μL) containing 0.0625nM B-Raf or 0.5nM C-Raf, 25 mM Tris pH7.4, 10 mM MgCl<sub>2</sub>, 0.5 mM EGTA, 0.5 mM Na<sub>3</sub>VO<sub>4</sub>, 5 mM beta-glycerophosphate, 0.01% Triton X-100, 2.5 mM DTT, 0.1% BSA, 0.1 mM ATP, 13.7 nM GST-tagged MEK1 (Full-length protein with K97R mutation, recombinant protein purified from bacterial expression system) and 0-5 μM compounds disclosed herein (final concentration of 1% DMSO). The enzyme was incubated with the compounds disclosed herein at room temperature for 60 minutes and the reactions were initiated by the addition of ATP and GST-MEK1. After reaction at room temperature for 60 minutes, an equal volume of stop/detection solution was added according to the manufacturer's instruction (CisBio Bioassays). The stop/detection solution contained Eu<sup>3+</sup> cryptate-conjugated anti-phospho MEK1/2 (Ser217/221) rabbit polyclonal antibody and d2-conjugated anti-GST mouse monoclonal antibody in buffer containing 25 mM Tris pH7.4, 400 mM KF, 50 mM EDTA, 0.01% BSA and 0.01% Triton X-100. Plates were sealed and incubated at room temperature for 2 hours, and the TR-FRET signals (ratio of fluorescence emission at 665 nm over emission at 620 nm with excitation at 337 nm wavelength) were recorded on a PHERAstar FS plate reader (BMG Labtech). Phosphorylation of MEK1 led to the binding of anti-phospho-MEK1/2 antibody to GST-MEK1 protein that place fluorescent donor (Eu<sup>3+</sup> cryptate) in close proximity

to the accepter d2 on the anti-GST antibody, thus resulting in a high degree of fluorescence resonance energy transfer from the donor fluorophore (at 620 nm) to the acceptor fluorophore (at 665 nm). Inhibition of RAF kinase activity resulted in decrease of the TR-FRET signal. The IC<sub>50</sub> for each compound was derived from fitting the dose-response % inhibition data to the 5 four-parameter logistic model by Graphpad Prism software.

#### WT BRaf IC<sub>50</sub> Assay Protocol

Compounds disclosed herein were tested against wild type B-Raf (PV3848, from Invitrogen) in a time-resolved fluorescence energy transfer assay. The assay was carried out in 10 reactions (10 µL) containing 0.5nM B-Raf, 25 mM Tris pH7.4, 10 mM MgCl<sub>2</sub>, 0.5 mM EGTA, 0.5 mM Na<sub>3</sub>VO<sub>4</sub>, 5 mM beta-glycerophosphate, 0.01% Triton X-100, 2.5 mM DTT, 0.1% BSA, 2.9 µM or 2.5 mM ATP, 10 nM GST-tagged MEK1 (Full-length protein with K97R mutation, recombinant protein purified from bacterial expression system) and 0-10 µM compounds disclosed herein (final concentration of 1% DMSO). The enzyme was incubated with the 15 compounds disclosed herein at room temperature for 120 minutes and the reactions were initiated by the addition of ATP and GST-MEK1. After incubating at room temperature for 60 minutes, an equal volume of stop buffer containing 25 mM Tris pH7.4, 400 mM KF, 50 mM EDTA, 0.1% BSA, 0.01% Triton X-100, 1 test of Eu3+ Cryptate-conjugated rabbit polyclonal antibody anti-Phospho MEK1/2 (Ser217/221) and 1 test of d2-conjugated mouse monoclonal 20 antibody anti-glutathione S-transferase was added to stop the reactions. Plates were sealed and incubated at room temperature for 1.5 hours, and then the TR-FRET signals were read on BMG PHERAstar FS instrument. The IC<sub>50</sub> for each compound was calculated by non linear regression by Graphpad Prism software.

The kinase was incubated with the compounds disclosed herein at room temperature for 120 minutes and the reaction was 35 initiated by the addition of ATP and biotin-TK substrate. After reaction at room temperature

for 30 minutes, an equal volume of stop/detection solution was added according to the manufacturer's instruction (CisBio Bioassays). The stop/detection solution contained TK-Antibody-Cryptate and Streptavidin-XL665 in buffer containing 25 mM Tris pH7.4, 400 mM KF, 50 mM EDTA, 0.01% BSA, 0.01% Triton X-100. Plates were sealed and incubated at 5 room temperature for 1 hour, and the TR-FRET signals were read on BMG PHERAstar FS instrument. The IC<sub>50</sub> of an inhibitor was derived from fitting the %inhibition data at each compound concentration to the four-parameter logistic equation by Graphpad Prism software.
