CYCLOBUTANE- AND AZETIDINE-CONTAINING MONO AND SPIROCYCLIC COMPOUNDS AS α_V INTEGRIN INHIBITORS

CROSS REFERENCE TO RELATED APPLICATION

5 This application claims the priority of U.S. Provisional Application serial number 62/418,859 filed November 8, 2016 which is herein incorporated by reference.

FIELD OF THE INVENTION

10 The present invention relates to substituted 3-azolopropionic acids as α_V integrin antagonists, pharmaceutical compositions comprising such compounds and to their use in therapy, especially in the treatment or prophylaxis of diseases, disorders, and conditions for which an α_V integrin antagonist is indicated in a human.

BACKGROUND OF THE INVENTION

15 Integrins belong to a large family of α/β heterodimeric transmembrane proteins that are involved in cell adhesion to a wide variety of extracellular matrix proteins, cell-cell interactions, cell migration, proliferation, survival, and in maintenance of tissue integrity (Barczyk *et al. Cell and Tissue Research* 2010, 339, 269; Srichai, M. B.; Zent, R. in *Cell-Extracellular Matrix Interactions in Cancer*, 2010). In mammals, there are 24 α/β integrin heterodimers known from
20 various combinations of 18 alpha and 8 beta subunits. Transforming Growth Factor- β (TGF- β) has a central role in driving a number of pathological processes underlying fibrosis, cell growth, and autoimmune diseases. Alpha V (α_V) Integrins, that include $\alpha_V\beta_1$, $\alpha_V\beta_3$, $\alpha_V\beta_5$, $\alpha_V\beta_6$, and $\alpha_V\beta_8$, are involved in a critical pathway that leads to the conversion of latent TGF- β to its active form (Henderson, N. C.; Sheppard, D. *Biochim, Biophys. Acta* 2013, 1832, 891). Thus,
25 antagonism of such α_V integrin-mediated activation of latent TGF- β provides a viable therapeutic approach to intervene in TGF- β -driven pathological states (Sheppard, D. *Eur. Resp. Rev.* 2008, 17, 157; Goodman, S. L.; Picard, M. *Trends Pharmacol. Sciences* 2012, 33(7), 405; Hinz, B. *Nature Medicine* 2013, 19(12), 1567; Pozzi, A.; Zent, R. *J. Am. Soc. Nephrol.* 2013, 24(7), 1034). All five α_V integrins belong to a small subset (8 out of 24) of integrins that recognize the Arginine-
30 Glycine-Aspartic acid (RGD) motif present in their native ligands such as fibronectin, vitronectin, and Latency-Associated Peptide (LAP).

 The expression of α_V integrin subtypes varies significantly. For example, $\alpha_V\beta_6$ is expressed on epithelial cells at very low levels in healthy tissue but is significantly upregulated during inflammation and wound healing. $\alpha_V\beta_3$ and $\alpha_V\beta_5$ are expressed on osteoclasts,
35 endothelial, smooth muscle, and solid tumor cells, as well as on pericytes and podocytes, while

α V β 1 is expressed on activated fibroblasts and mesangial cells.

Fibrotic conditions that represent major unmet medical needs are Idiopathic Pulmonary Fibrosis (IPF), liver and kidney fibrosis, Non-Alcoholic Fatty Liver Disease (NAFLD), Non-Alcoholic Steato-Hepatitis (NASH), as well as systemic sclerosis. Two drugs, pirfenidone and nintedanib, that act by non-integrin-mediated mechanisms, have recently been approved for treatment of IPF. The present invention relates to compounds that inhibit or antagonize the action of one or more of the α V integrins in the treatment of pathological conditions, such as fibrosis and cancer, mediated by these integrins.

A number of selective or nonselective small molecule, peptidic, and antibody-based antagonists of α V integrins have been reported in the literature (Kapp, T. G. *et al. Expert Opin. Ther. Patents* 2013, 23(10), 1273; O'Day, S. *et al. Brit. J. Cancer* 2011, 105(3), 346; Pickarski, M. *et al. Oncol. Rep.* 2015, 33, 2737; Wirth, M. *et al. Eur. Urol.* 2014, 897; Henderson, N. C. *et al. Nature Medicine* 2012, 19(12), 1617; Horan, G. S. *et al. Am. J. Resp. Crit. Care Med.* 2008, 177, 56; Puthawala, K. *et al. Am. J. Resp. Crit. Care Med.* 2008, 177, 82; Reed, N. I. *et al. Sci. Transl. Med.* 2015, 7(288), 288ra79; Anderson, N. A. *et al.* WO 2014/154725 A1, WO 2016/046225 A1, WO 2016/046226 A1, WO 2016/046230 A1, WO 2016/046241 A1).

10

The compounds of this invention can be administered for any of the uses described herein by any suitable means, for example, orally, such as tablets, capsules (each of which includes sustained release or timed release formulations), pills, powders, granules, elixirs, tinctures, suspensions, syrups, and emulsions; sublingually; buccally; parenterally, such as
15 by subcutaneous, intravenous, intramuscular, or intrasternal injection, or infusion techniques (*e.g.*, as sterile injectable aqueous or non-aqueous solutions or suspensions); nasally, including administration to the nasal membranes, such as by inhalation spray; topically, such as in the form of a cream or ointment; or rectally such as in the form of suppositories. They can be administered alone, but generally will be administered with a
20 pharmaceutical carrier selected on the basis of the chosen route of administration and standard pharmaceutical practice.

The term "pharmaceutical composition" means a composition comprising a compound of the invention in combination with at least one additional pharmaceutically acceptable
25 carrier. A "pharmaceutically acceptable carrier" refers to media generally accepted in the art for the delivery of biologically active agents to animals, in particular, mammals, including, *i.e.*, adjuvant, excipient or vehicle, such as diluents, preserving agents, fillers, flow regulating agents, disintegrating agents, wetting agents, emulsifying agents, suspending agents, sweetening agents, flavoring agents, perfuming agents, anti-bacterial
30 agents, anti-fungal agents, lubricating agents and dispensing agents, depending on the nature of the mode of administration and dosage forms. Pharmaceutically acceptable carriers are formulated according to a number of factors well within the purview of those of ordinary skill in the art. These include, without limitation: the type and nature of the

active agent being formulated; the subject to which the agent-containing composition is to be administered; the intended route of administration of the composition; and the therapeutic indication being targeted. Pharmaceutically acceptable carriers include both aqueous and non-aqueous liquid media, as well as a variety of solid and semi-solid dosage forms. Such carriers can include a number of different ingredients and additives in addition to the active agent, such additional ingredients being included in the formulation for a variety of reasons, *e.g.*, stabilization of the active agent, binders, etc., well known to those of ordinary skill in the art. Descriptions of suitable pharmaceutically acceptable carriers, and factors involved in their selection, are found in a variety of readily available sources such as, for example, *Remington's Pharmaceutical Sciences*, 18th Edition (1990).

The terms "treating" or "treatment" as used herein refer to an approach for obtaining beneficial or desired results, including clinical results, by using a compound or a composition of the present invention. For purposes of this invention, beneficial or desired clinical results include, but are not limited to, one or more of the following: decreasing the severity and/or frequency one or more symptoms resulting from the disease, disorder, or condition; diminishing the extent of or causing regression of the disease, disorder, or condition; stabilizing the disease, disorder, or condition (*e.g.*, preventing or delaying the worsening of the disease, disorder, or condition); delay or slowing the progression of the disease, disorder, or condition; ameliorating the disease, disorder, or condition state; decreasing the dose of one or more other medications required to treat the disease, disorder, or condition; and/or increasing the quality of life.

The dosage regimen for the compounds of the present invention will, of course, vary depending upon known factors, such as the pharmacodynamic characteristics of the particular agent and its mode and route of administration; the species, age, sex, health, medical condition, and weight of the recipient; the nature and extent of the symptoms; the kind of concurrent treatment; the frequency of treatment; the route of administration, the renal and hepatic function of the patient, and the effect desired.

By way of general guidance, the daily oral dosage of each active ingredient, when used for the indicated effects, will range between about 0.01 to about 5000 mg per day,

preferably between about 0.1 to about 1000 mg per day, and most preferably between about 0.1 to about 250 mg per day. Intravenously, the most preferred doses will range from about 0.01 to about 10 mg/kg/minute during a constant rate infusion. Compounds of this invention may be administered in a single daily dose, or the total daily dosage may be
5 administered in divided doses of two, three, or four times daily.

The compounds are typically administered in admixture with suitable pharmaceutical diluents, excipients, or carriers (collectively referred to herein as pharmaceutical carriers) suitably selected with respect to the intended form of administration, *e.g.*, oral tablets,
10 capsules, elixirs, and syrups, and consistent with conventional pharmaceutical practices.

Dosage forms (pharmaceutical compositions) suitable for administration may contain from about 1 milligram to about 2000 milligrams of active ingredient per dosage unit. In these pharmaceutical compositions the active ingredient will ordinarily be present in an
15 amount of about 0.1-95% by weight based on the total weight of the composition.

A typical capsule for oral administration contains at least one of the compounds of the present invention (250 mg), lactose (75 mg), and magnesium stearate (15 mg). The mixture is passed through a 60 mesh sieve and packed into a No. 1 gelatin capsule.
20

A typical injectable preparation is produced by aseptically placing at least one of the compounds of the present invention (250 mg) into a vial, aseptically freeze-drying and sealing. For use, the contents of the vial are mixed with 2 mL of physiological saline, to produce an injectable preparation.
25

The present invention includes within its scope pharmaceutical compositions comprising, as an active ingredient, a therapeutically effective amount of at least one of the compounds of the present invention, alone or in combination with a pharmaceutical carrier. Optionally, compounds of the present invention can be used alone, in
30 combination with other compounds of the invention, or in combination with one or more, preferably one to three, other therapeutic agent(s), *e.g.*, FXR agonists or other pharmaceutically active material.

The above other therapeutic agents, when employed in combination with the compounds of the present invention may be used, for example, in those amounts indicated in the *Physicians' Desk Reference*, as in the patents set out above, or as otherwise determined by one of ordinary skill in the art.

5

Particularly when provided as a single dosage unit, the potential exists for a chemical interaction between the combined active ingredients. For this reason, when the compound of the present invention and a second therapeutic agent are combined in a single dosage unit they are formulated such that although the active ingredients are
10 combined in a single dosage unit, the physical contact between the active ingredients is minimized (that is, reduced). For example, one active ingredient may be enteric coated. By enteric coating one of the active ingredients, it is possible not only to minimize the contact between the combined active ingredients, but also, it is possible to control the release of one of these components in the gastrointestinal tract such that one of these
15 components is not released in the stomach but rather is released in the intestines. One of the active ingredients may also be coated with a material that affects a sustained-release throughout the gastrointestinal tract and also serves to minimize physical contact between the combined active ingredients. Furthermore, the sustained-released component can be additionally enteric coated such that the release of this component occurs only in the
20 intestine. Still another approach would involve the formulation of a combination product in which the one component is coated with a sustained and/or enteric release polymer, and the other component is also coated with a polymer such as a low viscosity grade of hydroxypropyl methylcellulose (HPMC) or other appropriate materials as known in the art, in order to further separate the active components. The polymer coating serves to
25 form an additional barrier to interaction with the other component.

These as well as other ways of minimizing contact between the components of combination products of the present invention, whether administered in a single dosage form or administered in separate forms but at the same time by the same manner, will be
30 readily apparent to those skilled in the art, once armed with the present disclosure.

The compounds of the present invention can be administered alone or in combination with one or more, preferably one to three, additional therapeutic agents. By

"administered in combination" or "combination therapy" it is meant that the compound of the present invention and one or more, preferably one to three, additional therapeutic agents are administered concurrently to the mammal being treated. When administered in combination, each component may be administered at the same time or sequentially in
5 any order at different points in time. Thus, each component may be administered separately but sufficiently closely in time so as to provide the desired therapeutic effect.

The compounds of the present invention are also useful as standard or reference compounds, for example as a quality standard or control, in tests or assays involving the
10 α_v integrins. Such compounds may be provided in a commercial kit, for example, for use in pharmaceutical research involving α_v integrins activity. For example, a compound of the present invention could be used as a reference in an assay to compare its known activity to a compound with an unknown activity. This would ensure the experimenter that the assay was being performed properly and provide a basis for comparison,
15 especially if the test compound was a derivative of the reference compound. When developing new assays or protocols, compounds according to the present invention could be used to test their effectiveness.

The present invention also encompasses an article of manufacture. As used herein, article
20 of manufacture is intended to include, but not be limited to, kits and packages. The article of manufacture of the present invention, comprises: (a) a first container; (b) a pharmaceutical composition located within the first container, wherein the composition, comprises: a first therapeutic agent, comprising a compound of the present invention or a pharmaceutically acceptable salt form thereof; and, (c) a package insert stating that the
25 pharmaceutical composition can be used for the treatment of dyslipidemias and the sequelae thereof. In another embodiment, the package insert states that the pharmaceutical composition can be used in combination (as defined previously) with a second therapeutic agent for the treatment of fibrosis and the sequelae thereof. The article of manufacture can further comprise: (d) a second container, wherein components
30 (a) and (b) are located within the second container and component (c) is located within or outside of the second container. Located within the first and second containers means that the respective container holds the item within its boundaries.

The first container is a receptacle used to hold a pharmaceutical composition. This container can be for manufacturing, storing, shipping, and/or individual/bulk selling. First container is intended to cover a bottle, jar, vial, flask, syringe, tube (*e.g.*, for a cream preparation), or any other container used to manufacture, hold, store, or distribute a
5 pharmaceutical product.

The second container is one used to hold the first container and, optionally, the package insert. Examples of the second container include, but are not limited to, boxes (*e.g.*, cardboard or plastic), crates, cartons, bags (*e.g.*, paper or plastic bags), pouches, and
10 sacks. The package insert can be physically attached to the outside of the first container via tape, glue, staple, or another method of attachment, or it can rest inside the second container without any physical means of attachment to the first container. Alternatively, the package insert is located on the outside of the second container. When located on the outside of the second container, it is preferable that the package insert is physically
15 attached via tape, glue, staple, or another method of attachment. Alternatively, it can be adjacent to or touching the outside of the second container without being physically attached.

The package insert is a label, tag, marker, etc. that recites information relating to the
20 pharmaceutical composition located within the first container. The information recited will usually be determined by the regulatory agency governing the area in which the article of manufacture is to be sold (*e.g.*, the United States Food and Drug Administration). Preferably, the package insert specifically recites the indications for which the pharmaceutical composition has been approved. The package insert may be
25 made of any material on which a person can read information contained therein or thereon. Preferably, the package insert is a printable material (*e.g.*, paper, plastic, cardboard, foil, adhesive-backed paper or plastic, etc.) on which the desired information has been formed (*e.g.*, printed or applied).

30 III. DEFINITIONS

Throughout the specification and the appended claims, a given chemical formula or name shall encompass all stereo and optical isomers and racemates thereof where such isomers exist. Unless otherwise indicated, all chiral (enantiomeric and diastereomeric) and

racemic forms are within the scope of the invention. Many geometric isomers of C=C double bonds, C=N double bonds, ring systems, and the like can also be present in the compounds, and all such stable isomers are contemplated in the present invention. *Cis*- and *trans*- (or *E*- and *Z*-) geometric isomers of the compounds of the present invention are described and may be isolated as a mixture of isomers or as separated isomeric forms. The present compounds can be isolated in optically active or racemic forms. Optically active forms may be prepared by resolution of racemic forms or by synthesis from optically active starting materials. All processes used to prepare compounds of the present invention and intermediates made therein are considered to be part of the present invention. When enantiomeric or diastereomeric products are prepared, they may be separated by conventional methods, for example, by chromatography or fractional crystallization. Depending on the process conditions the end products of the present invention are obtained either in free (neutral) or salt form. Both the free form and the salts of these end products are within the scope of the invention. If so desired, one form of a compound may be converted into another form. A free base or acid may be converted into a salt; a salt may be converted into the free compound or another salt; a mixture of isomeric compounds of the present invention may be separated into the individual isomers. Compounds of the present invention, free form and salts thereof, may exist in multiple tautomeric forms, in which hydrogen atoms are transposed to other parts of the molecules and the chemical bonds between the atoms of the molecules are consequently rearranged. It should be understood that all tautomeric forms, insofar as they may exist, are included within the invention. As used herein, "a compound of the invention" or "compounds of the invention" means one or more compounds encompassed by Formula (I), (II), or (III), or a stereoisomer, a tautomer, or a pharmaceutically acceptable salt or solvate thereof.

As used herein, the term "alkyl" or "alkylene" is intended to include both branched and straight-chain saturated aliphatic hydrocarbon groups having the specified number of carbon atoms. For example, "C₁ to C₁₀ alkyl" or "C₁₋₁₀ alkyl" (or alkylene), is intended to include C₁, C₂, C₃, C₄, C₅, C₆, C₇, C₈, C₉, and C₁₀ alkyl groups. Additionally, for example, "C₁ to C₆ alkyl" or "C₁₋₆ alkyl" denotes alkyl having 1 to 6 carbon atoms. Alkyl group can be unsubstituted or substituted with at least one hydrogen being replaced by another chemical group. Example alkyl groups include, but are not limited to, methyl

(Me), ethyl (Et), propyl (*e.g.*, *n*-propyl and isopropyl), butyl (*e.g.*, *n*-butyl, isobutyl, *t*-butyl), and pentyl (*e.g.*, *n*-pentyl, isopentyl, neopentyl). When "C₀ alkyl" or "C₀ alkylene" is used, it is intended to denote a direct bond.

Unless otherwise indicated, the term "lower alkyl" as employed herein alone or as part of another group includes both straight and branched chain hydrocarbons containing 1 to 8 carbons, and the terms "alkyl" and "alk" as employed herein alone or as part of another group includes both straight and branched chain hydrocarbons containing 1 to 20 carbons, preferably 1 to 10 carbons, more preferably 1 to 8 carbons, in the normal chain, such as methyl, ethyl, propyl, isopropyl, butyl, *t*-butyl, isobutyl, pentyl, hexyl, isohexyl, heptyl, 4,4-dimethylpentyl, octyl, 2,2,4-trimethylpentyl, nonyl, decyl, undecyl, dodecyl, the various branched chain isomers thereof, and the like as well as such groups including 1 to 4 substituents such as halo, for example F, Br, Cl or I or CF₃, alkyl, alkoxy, aryl, aryloxy, aryl(aryl) or diaryl, arylalkyl, arylalkyloxy, alkenyl, alkynyl, cycloalkyl, cycloalkenyl, cycloalkylalkyl, cycloalkylalkyloxy, hydroxy, hydroxyalkyl, acyl, alkanoyl, heteroaryl, heteroaryloxy, cycloheteroalkyl, arylheteroaryl, arylalkoxycarbonyl, heteroarylalkyl, heteroarylalkoxy, aryloxyalkyl, aryloxyaryl, alkylamido, alkanoylamino, arylcarbonylamino, nitro, cyano, thiol, haloalkyl, trihaloalkyl and/or alkylthio.

"Heteroalkyl" refers to an alkyl group where one or more carbon atoms have been replaced with a heteroatom, such as, O, N, or S. For example, if the carbon atom of the alkyl group which is attached to the parent molecule is replaced with a heteroatom (*e.g.*, O, N, or S) the resulting heteroalkyl groups are, respectively, an alkoxy group (*e.g.*, -OCH₃, etc.), an amine (*e.g.*, -NHCH₃, -N(CH₃)₂, etc.), or a thioalkyl group (*e.g.*, -SCH₃). If a non-terminal carbon atom of the alkyl group which is not attached to the parent molecule is replaced with a heteroatom (*e.g.*, O, N, or S) and the resulting heteroalkyl groups are, respectively, an alkyl ether (*e.g.*, -CH₂CH₂-O-CH₃, etc.), an alkyl amine (*e.g.*, -CH₂NHCH₃, -CH₂N(CH₃)₂, etc.), or a thioalkyl ether (*e.g.*, -CH₂-S-CH₃). If a terminal carbon atom of the alkyl group is replaced with a heteroatom (*e.g.*, O, N, or S), the resulting heteroalkyl groups are, respectively, a hydroxyalkyl group (*e.g.*, -CH₂CH₂-OH), an aminoalkyl group (*e.g.*, -CH₂NH₂), or an alkyl thiol group (*e.g.*, -CH₂CH₂-SH). In accordance with a convention used in the art, a bond pointing to a bold line, such as

15  as used in structural formulas herein, depicts the bond that is the point of attachment of the moiety or substituent to the core or backbone structure.

In accordance with a convention used in the art, a wavy bond in a structural formula, such

as , is used to depict a stereogenic center of the carbon atom to which X', Y', and Z' are attached and is intended to represent both enantiomers in a single figure. That is, a structural formula with such as wavy bond denotes each of the enantiomers

individually, such as $X'-\overset{\overset{Z'}{\text{I}}}{\text{C}}-Y'$ or $X'-\overset{\overset{Z'}{\text{II}}}{\text{C}}-Y'$, as well as a racemic mixture thereof.

It is understood herein that if a carbocyclic or heterocyclic moiety may be bonded or otherwise attached to a designated substrate through differing ring atoms without denoting a specific point of attachment, then all possible points are intended, whether
25 through a carbon atom or, for example, a trivalent nitrogen atom. For example, the term “pyridyl” means 2-, 3- or 4-pyridyl, the term “thienyl” means 2- or 3-thienyl, and so forth.

When a dotted ring is used within a ring structure, this indicates that the ring structure may be saturated, partially saturated or unsaturated.

When a bond to a substituent is shown to cross a bond connecting two atoms in a ring, then such substituent may be bonded to any atom on the ring. When a substituent is listed without indicating the atom in which such substituent is bonded to the rest of the compound of a given formula, then such substituent may be bonded via any atom in such substituent. Combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

One skilled in the art will recognize that substituents and other moieties of the compounds of the present invention should be selected in order to provide a compound which is sufficiently stable to provide a pharmaceutically useful compound which can be formulated into an acceptably stable pharmaceutical composition. Compounds of the present invention which have such stability are contemplated as falling within the scope of the present invention.

The term "counter ion" is used to represent a negatively charged species such as chloride, bromide, hydroxide, acetate, and sulfate. The term "metal ion" refers to alkali metal ions such as sodium, potassium or lithium and alkaline earth metal ions such as magnesium and calcium, as well as zinc and aluminum.

As referred to herein, the term "substituted" means that at least one hydrogen atom is replaced with a non-hydrogen group, provided that normal valencies are maintained and that the substitution results in a stable compound. When a substituent is keto (*i.e.*, =O), then 2 hydrogens on the atom are replaced. Keto substituents are not present on aromatic moieties. When a ring system (*e.g.*, carbocyclic or heterocyclic) is said to be substituted with a carbonyl group or a double bond, it is intended that the carbonyl group or double bond be part (*i.e.*, within) of the ring. Ring double bonds, as used herein, are double bonds that are formed between two adjacent ring atoms (*e.g.*, C=C, C=N, or N=N).

In cases wherein there are nitrogen atoms (*e.g.*, amines) on compounds of the present invention, these may be converted to N-oxides by treatment with an oxidizing agent (*e.g.*, mCPBA and/or hydrogen peroxides) to afford other compounds of this invention. Thus, shown and claimed nitrogen atoms are considered to cover both the shown nitrogen and its N-oxide (N→O) derivative.

When any variable occurs more than one time in any constituent or formula for a compound, its definition at each occurrence is independent of its definition at every other occurrence. Thus, for example, if a group is shown to be substituted with 0, 1, 2, or 3 R

groups, then said group be unsubstituted when it is substituted with 0 R group, or be substituted with up to three R groups, and at each occurrence R is selected independently from the definition of R.

Also, combinations of substituents and/or variables are permissible only if such combinations result in stable compounds.

As used herein, the term "tautomer" refers to each of two or more isomers of a compound that exist together in equilibrium, and are readily interchanged by migration of an atom or group within the molecule. For example, one skilled in the art would readily understand that a 1,2,3-triazole exists in two tautomeric forms as defined above:

Thus, this disclosure is intended to cover all possible tautomers even when a structure depicts only one of them.

The phrase "pharmaceutically acceptable" is employed herein to refer to those compounds, materials, compositions, and/or dosage forms that are, within the scope of sound medical judgment, suitable for use in contact with the tissues of human beings and animals without excessive toxicity, irritation, allergic response, and/or other problem or complication, commensurate with a reasonable benefit/risk ratio.

The compounds of the present invention can be present as salts, which are also within the scope of this invention. Pharmaceutically acceptable salts are preferred. As used herein, "pharmaceutically acceptable salts" refer to derivatives of the disclosed compounds wherein the parent compound is modified by making acid or base salts thereof. The pharmaceutically acceptable salts of the present invention can be synthesized from the parent compound that contains a basic or acidic moiety by conventional chemical methods. Generally, such salts can be prepared by reacting the free acid or base forms of these compounds with a stoichiometric amount of the appropriate base or acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetonitrile are preferred. Lists of suitable salts are found in *Remington's Pharmaceutical Sciences*, 18th Edition, Mack Publishing Company, Easton, PA (1990), the disclosure of which is hereby incorporated by reference.

If the compounds of the present invention have, for example, at least one basic center, they can form acid addition salts. These are formed, for example, with strong inorganic acids, such as mineral acids, for example sulfuric acid, phosphoric acid or a hydrohalic acid, with organic carboxylic acids, such as alkanecarboxylic acids of 1 to 4 carbon atoms, for example acetic acid, which are unsubstituted or substituted, for example, by halogen as chloroacetic acid, such as saturated or unsaturated dicarboxylic acids, for example oxalic, malonic, succinic, maleic, fumaric, phthalic or terephthalic acid, such as hydroxycarboxylic acids, for example ascorbic, glycolic, lactic, malic, tartaric or citric acid, such as amino acids, (for example aspartic or glutamic acid or lysine or arginine), or benzoic acid, or with organic sulfonic acids, such as (C₁-C₄) alkyl or arylsulfonic acids which are unsubstituted or substituted, for example by halogen, for example methyl- or p-toluene- sulfonic acid. Corresponding acid addition salts can also be formed having, if desired, an additionally present basic center. The compounds of the present invention having at least one acid group (for example COOH) can also form salts with bases.

Suitable salts with bases are, for example, metal salts, such as alkali metal or alkaline earth metal salts, for example sodium, potassium or magnesium salts, or salts with ammonia or an organic amine, such as morpholine, thiomorpholine, piperidine, pyrrolidine, a mono, di or tri-lower alkylamine, for example ethyl, tert-butyl, diethyl, diisopropyl, triethyl, tributyl or dimethyl-propylamine, or a mono, di or trihydroxy lower alkylamine, for example mono, di or triethanolamine. Corresponding internal salts may furthermore be formed. Salts which are unsuitable for pharmaceutical uses but which can be employed, for example, for the isolation or purification of free compounds of Formula I or their pharmaceutically acceptable salts, are also included.

Preferred salts of the compounds of Formula I which contain a basic group include monohydrochloride, hydrogensulfate, methanesulfonate, phosphate, nitrate or acetate. Preferred salts of the compounds of Formula I which contain an acid group include sodium, potassium and magnesium salts and pharmaceutically acceptable organic amines. In addition, the compounds of the present invention may have prodrug forms. Any compound that will be converted *in vivo* to provide the bioactive agent is a prodrug within the scope and spirit of the invention. The term “prodrug” as used herein encompasses both the prodrugs based on the carboxylic acid residue, i.e., “prodrug esters”, and the prodrugs based on the arginine mimetics moiety, i.e., “prodrugs of arginine mimetics”. Such prodrugs are preferably administered orally since hydrolysis in many instances

occurs principally under the influence of the digestive enzymes. Parenteral administration may be used where the ester *per se* is active, or in those instances where hydrolysis occurs in the blood.

The compounds of the present invention contain a carboxy group which can form
 5 physiologically hydrolyzable esters that serve as prodrugs, i.e., “prodrug esters”, by being hydrolyzed in the body to yield the compounds of the present invention *per se*. Examples of physiologically hydrolyzable esters of compounds of the present invention include C₁ to C₆ alkyl, C₁ to C₆ alkylbenzyl, 4-methoxybenzyl, indanyl, phthalyl, methoxymethyl, C₁₋₆ alkanoyloxy-C₁₋₆ alkyl (*e.g.*, acetoxymethyl, pivaloyloxymethyl or
 10 propionyloxymethyl), C₁ to C₆ alkoxycarbonyloxy-C₁ to C₆ alkyl (*e.g.*, methoxycarbonyl-oxymethyl or ethoxycarbonyloxymethyl, glycyloxymethyl, phenylglycyloxymethyl, (5-methyl-2-oxo-1,3-dioxolen-4-yl)-methyl), and other well known physiologically hydrolyzable esters used, for example, in the penicillin and cephalosporin arts. Such esters may be prepared by conventional techniques known in
 15 the art. The “prodrug esters” can be formed by reacting the carboxylic acid moiety of the compounds of the present invention with either alkyl or aryl alcohol, halide, or sulfonate employing procedures known to those skilled in the art. Examples of such prodrug esters include:

The compounds of the present invention contain an arginine mimetics moiety which can form physiologically hydrolyzable esters that serve as prodrugs, i.e., “prodrugs of arginine mimetics”, by being hydrolyzed in the body to yield the compounds of the present invention *per se*. Representative examples of prodrugs of arginine mimetics

5 include:

wherein, one of the asterisks in each of the arginine mimetics moiety is an attachment point to the parent molecule and the other two asterisks are hydrogen; $R^f = H, Me, Et, COOEt$; $R^g = CH_3, CH_2CH_3, CH_2CCl_3, phenyl, 4-fluorophenyl, 4-methoxyphenyl, benzyl,$

10 R^e is $OH, C_{1-4} alkyl, halo, haloalkyl, or C_{1-4}$

cycloalkyl; and r is an integer of 0, 1, 2, or 3.

Furthermore, various forms of prodrugs are well known in the art. For examples of such prodrug derivatives, see:

The present invention is intended to include all isotopes of atoms occurring in the present compounds. Isotopes include those atoms having the same atomic number but different

15 mass numbers. By way of general example and without limitation, isotopes of hydrogen

include deuterium and tritium. Isotopes of carbon include ^{13}C and ^{14}C . Isotopically-labeled compounds of the invention can generally be prepared by conventional techniques known to those skilled in the art or by processes analogous to those described herein,

using an appropriate isotopically-labeled reagent in place of the non-labeled reagent

20 otherwise employed. Such compounds have a variety of potential uses, *e.g.*, as standards and reagents in determining the ability of a potential pharmaceutical compound to bind to target proteins or receptors, or for imaging compounds of this invention bound to biological receptors *in vivo* or *in vitro*.

"Stable compound" and "stable structure" are meant to indicate a compound that is

25 sufficiently robust to survive isolation to a useful degree of purity from a reaction mixture, and formulation into an efficacious therapeutic agent. It is preferred that compounds of the present invention do not contain a N-halo, $\text{S}(\text{O})_2\text{H}$, or $\text{S}(\text{O})\text{H}$ group.

The term "solvate" means a physical association of a compound of this invention with one or more solvent molecules, whether organic or inorganic. This physical association

30 includes hydrogen bonding. The solvent molecules in the solvate may be present in a regular arrangement and/or a non-ordered arrangement. The solvate may comprise either a stoichiometric or nonstoichiometric amount of the solvent molecules. "Solvate"

encompasses both solution-phase and isolable solvates. Exemplary solvates include, but are not limited to, hydrates, ethanolates, methanolates, and isopropanolates. Methods of solvation are generally known in the art.

IV. METHODS OF PREPARATION

The compounds of the present invention can be prepared in a number of ways well known to one skilled in the art of organic synthesis using the methods described below, together with synthetic methods known in the art of synthetic organic chemistry, or variations thereon as appreciated by those skilled in the art. Preferred methods include, but are not limited to, those described below. All references cited herein are hereby incorporated in their entirety by reference. The reactions are performed in a solvent or solvent mixture appropriate to the reagents and materials employed and suitable for the transformations being affected. It will be understood by those skilled in the art of organic synthesis that the functionality present on the molecule should be consistent with the transformations proposed. This will sometimes require a judgment to modify the order of the synthetic steps or to select one particular process scheme over another in order to obtain a desired compound of the invention. Restrictions to the substituents that are compatible with the reaction conditions will be readily apparent to one skilled in the art and alternate methods must then be used. It will also be recognized that another major consideration in the planning of any synthetic route in this field is the judicious choice of the protecting group used for protection of the reactive functional groups present in the compounds described in this invention. A particularly useful compendium of synthetic methods which may be applicable to the preparation of compounds of the present invention may be found in Larock, R.C., *Comprehensive Organic Transformations*, VCH, New York (1989).

The compounds of the present invention may be prepared using the reactions and techniques described in this section. The reactions are performed in solvents appropriate to the reagents and materials employed and are suitable for the transformations being effected. Also, in the description of the synthetic methods described below, it is to be

understood that all proposed reaction conditions, including solvent, reaction atmosphere, reaction temperature, duration of the experiment and workup procedures, are chosen to be the conditions standard for that reaction, which should be readily recognized by one skilled in the art. One skilled in the art of organic synthesis understands that the

5 functionality present on various portions of the edict molecule must be compatible with the reagents and reactions proposed. Not all compounds of Formula I falling into a given class may be compatible with some of the reaction conditions required in some of the methods described. Such restrictions to the substituents, which are compatible with the reaction conditions, will be readily apparent to one skilled in the art and alternate methods

10 must be used. A particularly useful compendium of synthetic methods which may be applicable to the preparation of compounds of the present invention may be found in Larock, R.C., *Comprehensive Organic Transformations*, VCH, New York (1989).

GENERIC SCHEMES

15 Azaspiroheptane analogs of Formula (I') can be prepared according to the general routes shown in Schemes 1-4 using methods known in the literature. Those skilled in the art would recognize that these methods are also applicable to generate analogous monocyclic azetidines and that the sequence of transformations can be altered depending on the specific target of interest. As shown in Scheme 1, N-protected azaspiroheptane

20 acid 1 can be coupled with α -aminoacid 2 under standard coupling conditions such as BOP/DIEA or EDC/base, to yield ester 3. Aminoesters 2 can be prepared using methods known in the literature (for example, Hutchinson, J. H. *et al.* *J. Med Chem.* 2003, 46, 4790; Henderson, N. C. *et al.* *Nature Medicine* 2013, 19, 1617). Deprotection of the

25 amine, followed by coupling with a suitably functionalized acid under standard acid-amine coupling conditions, and then final deprotections can yield compound of Formula (I') where A = CO and Y = CONH.

Scheme 1: General Scheme for preparation of Formula (I') where A = CO and Y = CONH

Compounds of Formula (I'), when Y = CO and $\text{R}^5 = \text{H}$, were obtained by first reacting azole-acid 2 with aminoester 4 under standard amide coupling conditions known to those skilled in the art, followed by deprotection of the resulting carboxylic ester.

- 5 Aminoesters 4 can be prepared using methods known in the literature (for example, Hutchinson, J. H. *et al.* *J. Med Chem.* 2003, 46, 4790; Henderson, N. C. *et al.* *Nature Medicine* 2013, 19, 1617). Compounds of Formula (I), when Y = CH_2 and $\text{R}^5 = \text{H}$, were obtained by alkylating aminoester 4 with azole 3 or via a reduction amination of azole-aldehyde or azole-ketone 5 and aminoester 4, followed by deprotection of the resulting
- 10 carboxylic ester.

Scheme 2: General Scheme for preparation of Formula (I'), where $\text{R}^1 =$ tetrahydronaphthylidene and X = CH_2CH_2 , Y = CONH, and A = bond

Compounds of Formula (I') where the arginine mimic is a tetrahydronaphthyridine and $X = \text{CH}_2\text{CH}_2$, can be prepared from amine intermediate 4 as outlined in Scheme 2. A ketone intermediate generated from acid-mediated deprotection of ketal 6 was condensed with 2-amino-3-formylpyridine using Friedländer reaction conditions (Jose Marco-Contelles; Elena Perez-Mayoral; Abdelouahid Samadi; Maria do Carmo Carreiras; Elena Soriano (2009). "Recent Advances in the Friedlander Reaction". *Chemical Reviews*. 109 (6): 2652–71) to yield naphthyridine ester 7. Selective hydrogenation in the presence of PtO_2 catalyst followed by base hydrolysis of the resulting ester can afford compounds of Formula (I').

Scheme 3: General Scheme for preparation of Formula (I') and (I''), where $Y = \text{CONH}$, $X = (\text{CH}_2)_2$ or $(\text{CH}_2)_3$, and $A = \text{bond}$

As outlined in Scheme 3, compounds of Formula (I') where $X = (\text{CH}_2)_3$ can be prepared in a manner analogous to the one described in Scheme 2 except that the alkylating agent used would be 1-bromo-4-oxopentane (5). Friedländer ring-formation can yield a mixture of isomeric products 9 and 10, each of which can be transformed as described before to afford compounds of Formula (I') or (I'').

Scheme 4: General Scheme for preparation of Formula (I'), where X = (CH₂)₂, Y = CONH, and A = bond

Compounds of Formula (I') where X = CH₂CH₂ can also be prepared as shown in Scheme 4 via alkylation of amine 11 with intermediate 12 followed by transformations analogous to the ones described earlier.

Scheme 5: General Scheme for preparation of Formula (I'), where X = (CH₂)₂, R¹ = tetrahydronaphthyridine, and A = bond

Scheme 5 depicts the synthesis of [3.3.0]spiroheptanes of Formula (I') with tetrahydronaphthyridine as an arginine mimetic. Analogous sequences can be applied to cyclobutanes and [3.3.0]spiroheptanes that have substitutions as defined in claim 1. Condensation of aldehyde 17 with 2-methyl-1,8-naphthyridine in the presence of *p*-

tolylsulfonamide can yield olefin 18 (Yan, Y. *et al.* *J. Org. Chem.* 2011, 76, 6849) which can be reduced under catalytic hydrogenation conditions to afford tetrahydronaphthyridine ester 19. Alternatively, intermediate 19 can be obtained via a Wittig reaction of aldehyde with the known ylide 20 (Anderson, N. A. *et al.*, WO2016046226 (2016). Compounds of Formula (I') can then be obtained by hydrolysis of ester 19 followed by coupling with amine 2 and final deprotection.

Scheme 6: General Scheme for preparation of Formula (I'), where X = (CH₂)₂, Y = CONH, and A = bond

Urea-containing compounds of Formula (I') can be prepared as described in Scheme 6 from intermediate 25, which in turn can be prepared in a manner analogous to

the one described in Scheme 5. Thus, reaction of 25 with amine 2 in the presence of dicarbonylimidazole can yield urea ester 26. Hydrolysis and catalytic hydrogenation can then afford compounds of Formula (I'). An alternative approach to compounds of Formula (I') can be via a Wittig reaction of aldehyde 23 with ylide 20 followed by subsequent functionalization as described earlier.

Scheme 7: General Scheme for preparation of Formula (I'), where X = (CH₂)₂, Y = CO, and A = bond

As shown in Scheme 7, amide-containing azetidine compounds of Formula (I') can be obtained from intermediate 25 via coupling with acid 28 followed by hydrolysis and catalytic hydrogenation. Analogous amide-containing [3.3.0]azaspiroheptanes of Formula (I') can be obtained in a manner similar to the azetidines shown in Scheme 7.

Scheme 8: General Scheme for preparation of Formula (I'), where X = (CH₂)₂, Y = CH₂, and A = bond

As shown in Scheme 8, reductive amination of aldehyde 31 with amine 33 followed by hydrolysis can yield compounds of Formula (I').

Scheme 10: General Scheme for preparation of Formula (I'), where X = (CH₂)₃, Y = O, R³ = H, and A = bond

Compounds of Formula (I') with Y = O can be prepared as depicted in Scheme 10. Ring-opening of aziridine 46 with alcohol 45 under Lewis acid conditions can yield ether 47.

Deprotection of the amine followed by reductive amination with aldehyde 44 and ester

5 hydrolysis can afford compounds of Formula (I').

Scheme 11: General Scheme for preparation of Formula (I'), where X = (CH₂)₂₋₃, Y = NR⁶, and A = bond

3-Aminoazetidines of Formula (I') can be obtained as described in Scheme 11.

Intermediate 52 can be obtained via reductive amination of N-Boc protected 3-oxoazetidine 50 with amine 2 followed by deprotection. The R⁶ group could be installed by reaction of 51 with a suitable alkyl or acyl halide in the presence of base to afford compound 54 after Boc deprotection. Compound 54, with or without an R⁶ substitution, can be subjected to reductive amination with 44 [X = (CH₂)₃] or alkylation with 12 [X = (CH₂)₂] to yield compounds of Formula (I') after final deprotections.

Scheme 12: General Scheme for preparation of Formula (I'), where X = (CH₂)₂₋₃, Y = CONH, and A = bond

As outlined in Scheme 12, azetidines of Formula (I') substituted with an R² group can be obtained in a manner analogous to the one described in previous schemes.

Scheme 7: General Scheme for preparation of Formula (I'), where X = (CH₂)₂, Y = CO, and A = bond

As shown in Scheme 8, reductive amination of aldehyde 31 with amine 33 followed by hydrolysis can yield compounds of Formula (I').

Scheme 9: General Scheme for preparation of Formula (I'), where X = (CH₂)₄, R² = oxo, and A and Y = bond

- 5 Scheme 9 shows the general preparation of azetidinones of Formula (I'). Compound 35, obtained from acid 34 and amine 2 using standard coupling conditions, can be treated with methanesulfonylchloride and then cyclized using NaH to form azetidinone 36. Wacker oxidation (Smidt, J. *et al. Angew. Chem.* 1959, 71, 176) of 36 followed by functionalization as described before can afford compounds of Formula (I').

Scheme 10: General Scheme for preparation of Formula (I'), where X = (CH₂)₃, Y = O, R³ = H, and A = bond

Compounds of Formula (I') with Y = O can be prepared as depicted in Scheme 10. Ring-opening of aziridine 46 with alcohol 45 under Lewis acid conditions can yield ether 47.

Deprotection of the amine followed by reductive amination with aldehyde 44 and ester

5 hydrolysis can afford compounds of Formula (I').

Scheme 11: General Scheme for preparation of Formula (I'), where X = (CH₂)₂₋₃, Y = NR⁶, and A = bond

3-Aminoazetidines of Formula (I') can be obtained as described in Scheme 11.

Intermediate 52 can be obtained via reductive amination of N-Boc protected 3-oxoazetidine 50 with amine 2 followed by deprotection. The R⁶ group could be installed by reaction of 51 with a suitable alkyl or acyl halide in the presence of base to afford compound 54 after Boc deprotection. Compound 54, with or without an R⁶ substitution, can be subjected to reductive amination with 44 [X = (CH₂)₃] or alkylation with 12 [X = (CH₂)₂] to yield compounds of Formula (I') after final deprotections.

Scheme 12: General Scheme for preparation of Formula (I'), where X = (CH₂)₂₋₃, Y = CONH, and A = bond

As outlined in Scheme 12, azetidines of Formula (I') substituted with an R² group can be obtained in a manner analogous to the one described in previous schemes.

- 5 Alternatively, the sequence of steps can be altered to install the N-Boc protected tetrahydronaphthyridine moiety before coupling with a desired 2-aminopropionic ester.

Scheme 13: General Scheme for preparation of Formula (I'), where X = (CH₂)₂₋₃, Y = COCH₂, R⁴ = H, and A = bond

Amides of Formula (I') can be obtained by conversion of aldehyde 57 to cyclic anhydride 58, ring-opening with ethanol, and coupling with a suitably functionalized azetidine 59 (Scheme 13). Further functionalization of the A¹ group can generate compounds of Formula (I'). Compound 61 is an example of a substituted azetidine, in which case, functionalization of the A¹ group would involve hydrogenation in the presence of a suitable catalyst such as PtO₂.

Scheme 14 describes a method to prepare azetidine analogs (I') where the 3-position of the azetidine is attached to the 3-position of the propionic acid. N-Boc protected azetidine acid 62 can be transformed to unsaturated ester 65 using standard methods known in the literature. A Hayashi conjugate addition of a suitable boronic acid in the presence of a rhodium catalyst can afford 3-substituted propionic acid 66 (Hayashi, T. *Synlett* 2001, 879-887). Intermediate 67, obtained from deprotection of 66, can then be converted to amides or amines as shown in Scheme 14 using protocols discussed in earlier schemes.

Scheme 14: General Scheme for preparation of Formula (I'), where X = (CH₂)₂₋₃ and Y = bond

Scheme 15 outlines synthesis of compounds of the invention (I') where the azetidine nitrogen is attached to the 3-position of the propionic acid. Thus, alkylation of diethyl malonate 69 followed by reduction of the two ester groups can yield diol 71.

- 5 Conversion of the diol to the bis-triflate and bis-alkylation of α -aminoester 2 can yield azetidine 72. Wacker oxidation of 72 followed by further functional group modifications as described earlier can afford compounds of the present invention (I').

Scheme 15: General Scheme for preparation of Formula (I'), where X = (CH₂)₃₋₄, Y = bond, and A = bond

An example of compounds of the present invention (I') where a 4-membered carbocyclic ring [which can be monocyclic, [3.3.0]bicyclic or [3.3.0]azabicyclic) is attached to the 3-position of the propionic acid can be synthesized using a sequence similar to the one outlined in Scheme 16. Alternatively, as shown in Scheme 17, the sequence of steps can be altered as suitable to obtain the desired compounds of the present invention (I') depending on the specific examples targeted. Thus, a Hayashi conjugate addition to unsaturated esters such as 77 (Scheme 16) or 83 (Scheme 17) can install the R³ group. Subsequent derivatization of aldehyde 79 and final deprotections can afford the desired compounds of Formula (I').

Scheme 16: General Scheme for preparation of Formula (I'), where X = (CH₂)₃₋₄, Y = bond, and A = bondScheme 17: General Scheme for preparation of Formula (I'), where X = (CH₂)₃₋₄, Y = bond, and A = bond

HPLC/MS AND PREPARATORY/ANALYTICAL HPLC METHODS EMPLOYED IN CHARACTERIZATION OR PURIFICATION OF EXAMPLES

NMR (nuclear magnetic resonance) spectra were typically obtained on Bruker or JEOL 400 MHz and 500 MHz instruments in the indicated solvents. All chemical shifts are reported in ppm from tetramethylsilane with the solvent resonance as the internal standard. ¹HNMR spectral data are typically reported as follows: chemical shift, multiplicity (s = singlet, br s = broad singlet, d = doublet, dd = doublet of doublets, t = triplet, q = quartet, sep = septet, m = multiplet, app = apparent), coupling constants (Hz), and integration.

BIOLOGICAL EVALUATION

5 All binding assays used the HTRF (homogeneous time resolved fluorescence) technology from Cisbio International, therefore all assays are described as HTRF binding assays. The assay results for the Examples are listed above together with the characterization data. The HTRF binding assays are established for the following integrins: human α V β 6, human α V β 1, human α V β 3, human α V β 5, and human α V β 8. All
10 assays used the following assay buffer: 20 mM Tris, pH 7.4, 1 mM MgCl₂, 1 mM MnCl₂, 0.01% Tween 20, and 0.01% BSA. Alternatively, a SPA-based assay was used for evaluation of receptor binding.

The following describes the components and a representative procedure for the human α V β 6 HTRF binding assay: Recombinant human α V β 6 Integrin (R & D systems, 3817-AV) was biotinylated. Biotinylated human α V β 6 Integrin was added to assay vessel
15 at a final concentration of 1.25 nM. FITC-conjugated fibronectin (Cytoskeleton, FNR02) was then added at the final concentration of 5 nM. The mixture was centrifuged at 600 rpm for three minutes using Thermo Fisher Heraeus Multifuge X3 centrifuge and then incubated at RT for an hour. Streptavidin Terbium (Cisbio international 610STLB) was
20 then added at the final concentration of 0.625 nM. The resulting mixture was centrifuged at 600 rpm for three minutes using Thermo Fisher Heraeus Multifuge X3 centrifuge and then incubated at room temperature overnight in dark before reading HTRF signals.

The SPA-based assay was carried out according to the protocol and procedures similar to the ones described in the following reference with appropriate modifications to
25 agents and ligands which are readily understood by one skilled in the art: Pachter JA, Zhang R, Mayer-Ezell R., "Scintillation proximity assay to measure binding of soluble fibronectin to antibody-captured α V β 1 integrin" Anal Biochem. 1995 Sep 1;230(1):101-7.
